KEY WORDS: Diptera, Scathophagidae, *Norellisoma*, Russia, review, new synonyms, new records.

КЛЮЧЕВЫЕ СЛОВА: Diptera, Scathophagidae, *Norellisoma*, Россия, обзор, новые синонимы, новые находки.

ABSTRACT. Flies of the genus *Norellisoma* Wahlgren, 1917 of Russia, which includes 12 species, are reviewed. Generic and species descriptions and key for determination of species are given, and data on distributions are summarized. One new synonym is proposed: *Norellisoma lituratum* (Meigen, 1826) = *N. altaicum* (Ozerov, 2008), syn.n. New records of the following species are given: *Norellisoma caucasicum* (Ozerov, 1993) (Azerbaijan, Kazakhstan); *N. lesiae* (Becker, 1894), *N. montanopratense* (Ozerov, 1993) (Abkhazia); *N. spinimanum* (Fallén, 1819) (Kazakhstan).

РЕЗЮМЕ. Дан обзор двукрылых рода *Norellisoma* Wahlgren, 1917 фауны России, включающего 12 видов. Приведены диагноз рода, описания видов и ключ для определения видов рода *Norellisoma* России, а также суммированы данные по распространению видов рода на территории России. Установлен один новый синоним: *Norellisoma lituratum* (Meigen, 1826) = *N. altaicum* (Ozerov, 2008), syn.n. Приведены новые данные о распространении следующих видов: *Norellisoma caucasicum* (Ozerov, 1993) (Азербайджан, Казахстан); *N. lesiae* (Becker, 1894), *N. montanopratense* (Ozerov, 1993) (Абхазия); *N. spinimanum* (Fallén, 1819) (Казахстан).

Introduction

Norellisoma Wahlgren, 1917 is not large genus within the family Scathophagidae and consists of 28 species distributed in the Northern Hemisphere (1 Hol-

arctic, 27 Palaearctic) [Vockeroth, 1965; Šifner, 2008; Ozerov, 2008, 2009, 2010a; Ozerov, 2013].

The fauna of Russia includes 12 species [Becker, 1894; Gorodkov, 1970, 1986; Šifner, 2008; Ozerov, 2008, 2009, 2010a, b; Ovchinnikov, 2013; Ozerov, Krivosheina, 2014; Bagachanova *et al.*, 2016], but no general work has been fulfilled.

Adults of some species of *Norellisoma* are often collected at locations where *Rumex* spp. (Polygonaceae) grow, usually on the leaves of these plants. I collected adults of *N. armipes* in a meadow of confluent of the Ruza river with *Urtica dioica* (Urticaceae) and *Campanula latifolia* (Campanulaceae) [Ozerov, 2010a]. Adults were on leaves of *C. latifolia* in the second half of May till about the second half of June before plants formed buds or flowers.

Larvae of *N. spinimanum* (Fallén) mine stems of *Rumex* [Ferrar, 1987]. Description of immature stages of *N. spinimanum* (Fallén) was given by Disney [1976].

Material and methods

The specimens examined for this study are deposited in the Zoological Museum, Moscow State University, Russia (ZMUM) and Zoological Institute of Russian Academy of Sciences, St. Petersburg, Russia (ZISP). We also studied some material from the Institute of Systematics and Ecology of Animals, Russian Academy of Sciences, Siberian Branch, Novosibirsk, Russia (ISEA) and Oxford University Museum, Oxford, England (UMO).

Fig. 1. Male of *Norellisoma spinimanum* (Fallén). After Ozerov, 2010a, fig. 1.
Рис. 1. Самец *Norellisoma spinimanum* (Fallén). По Озеров, 2010а, фиг. 1.

The majority of original Russian geographical names are given in transliteration, but names of some large geographical regions (e.g. Altai (=Altai Krai + Altai Republic), Krasnoyarsk Krai, Primorsky Krai, Sakha Republic (=Yakutia), Zabaykalsky Krai) follow these indicated in Google Earth software.

The terminology used in the generic and species descriptions follows McAlpine [1981], Cumming & Wood [2009], and Stuckenbergs [1999].

Taxonomic part

Norellisoma Wahlgren, 1917

Norellisoma Hendel, 1910: 308. Nomen nudum.

Norellisoma Wahlgren, 1917: 148 [as *Norellisoma* Hendel, 1910]. Gender: neuter. Type-species: *Cordylura spinimana* Fallén, 1819, by designation of Vockeroth, 1965.

Norelliosoma, error.

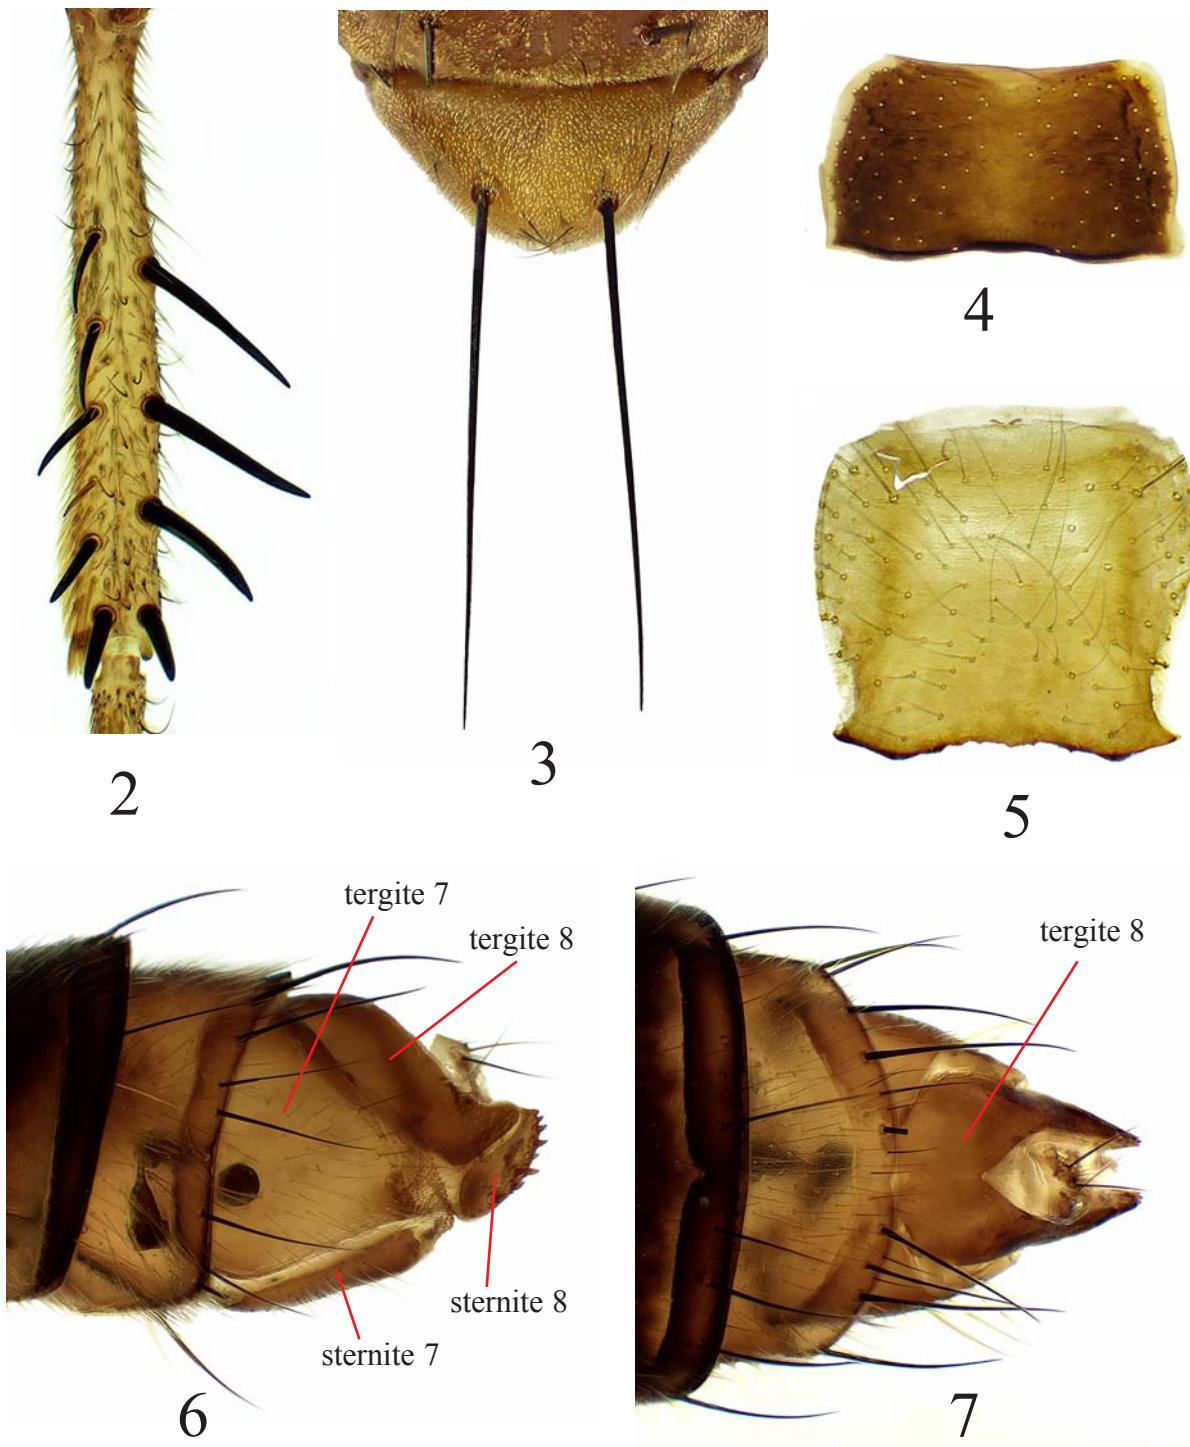

Norellisoma species are small or medium-sized flies (3.5–8.7 mm long). Colour varies from yellow to black.

Head. Frontal vitta yellow, rarely blackish in upper part, matt; fronto-orbital plate yellow completely or blackish in upper part, greyish dusted; ocellar triangle black. Face, parafacial and gena yellowish, whitish dusted. Postcranium usually blackish in upper half and yellow in lower part or yellow almost completely, greyish dusted, usually covered with black setulae in upper third and pale hairs in lower part. Setae: 2 orbitals, 2–4

frontals, 1 ocellar, 1 postocellar (small, divergent), 1 inner vertical, 1 outer vertical; one pair of vibrissae present. Antenna from yellow to blackish. Postpedicel rounded apically, approximately 2–2.5 times as long as wide. Arista yellowish or blackish, basally thickened, pubescent. Clypeus and proboscis yellowish or brownish. Palpus elongate and slender, yellow, without long apical seta.

Thorax from yellow to black, grey dusted. Scutum with the following paired setae: (1+2)+(2+3) dorsocentrals, scapular pair present or absent, intra-alars absent, (0–1)+2 supra-alars, 0–1 postpronotal, 1–2 notopleurals, 1–2 postalar. Proepisternum with hairs in central part, with 0–1 seta near lower margin. Proepimeron with 0–1 seta and several hairs. Anepisternum covered with hairs in posterior half, with 1–3 setae near posterior margin. Katepisternum covered with hairs in posterior half and with one strong seta in upper posterior corner. Anepimeron bare. Postmetacoxal bridge absent. Scutellum greyish dusted, with a pair of strong discal scutellar setae (Fig. 3).

Legs yellow in ground color, sometimes mid and hind femora blackish dorsally. Fore femur with rows of long posteroventral and of short anteroventral setae. Fore tibia with 4–7 strong posteroventral and 5–8 strong anteroventral setae (Fig. 2), also with 1–2 dorsal/anterodorsal, 1 posterodorsal and 1 preapical dorsal setae. Mid femur with 3–6 setae anteriorly in api-

cal part, with 1 preapical posterior seta and 2–3 antero-ventral setae in apical third, in males of some species additionally with hairs ventrally. Mid tibia with 1–2 anteroventral, 1–2 anterodorsal, 1–2 posterodorsal, 1–3 posteroventral setae and a ring of apicals, in male of some species additionally with long hairs ventrally. Hind femur with a row of anterodorsal setae, with 1–4 anteroventral setae in apical quarter. Hind tibia with 1–3 anterodorsal, 2–3 posterodorsal, 0–1 anteroventral in apical quarter, 1 preapical dorsal and 1 apical antero-ventral setae.

Wing tinged with whitish or brownish, veins brownish; vein R_1 bare dorsally (rarely (some specimens of *N. lituratum*) with 1–2 setulae dorsally near apex). Calypters, margins of calypters, and halteres yellowish or brownish.

Abdomen cylindrical, black, greyish dusted. Female segments 7–8 subshining or shining, flattened laterally. Male sternite 4 rectangular, as wide as long (Fig. 5) or wider than long (Fig. 4). Sternite 5 with narrow or wide triangular lateral lobes, in some species with short median projections (Figs 11, 16). Male terminalia (Figs 20–54): epandrium with symmetrical surstyli having the appearance of ticks; surstyli often broadened apically; cerci fused apically or medially forming cercal plate. Female ovipositor short, compressed laterally, with proctiger shifted dorsally (Figs 6, 7); tergite 8 in form of ring not closed in distal part (Figs 6, 7), sternite 8 covered with spines (Fig. 6).

Norellisoma armipes Meigen, 1826
Figs 8, 20–22.

armipes Meigen, 1826: 234 (*Cordylura*). Type-locality: locality not stated.

flavicauda Meigen, 1826: 235 (*Cordylura*). Type-locality: not given.

flava von Roser, 1840: 59 (*Cordylura*). Type-locality: not given (?Würtemberg).

roserii Rondani, 1866: 17 (*Norellia*). Type-locality: “Specimen germanicum...” (Germany).

MATERIAL. **Moscow Oblast:** Ignatkovo env. (55.939°N 35.6225°E), 10 and 15.VI.2011, 23.VI.2012, A.L. Ozerov (6 ♂♂, 1 ♀, ZMUM); Ivanovskoe env. (55.939°N 35.621°E), 12.VI.2006, A.L. Ozerov (1 ♂, 1 ♀, ZMUM); Naro-Fominsk (55.372°N 36.757°E), 14.V.2010, D. Gavyushin (1 ♂, ZMUM); Anikeevka (55.827°N 37.214°E), 23.VIII.1983, Gorodkov (3 ♂♂, 1 ♀, ZISP).

ADDITIONAL MATERIAL. **Ukraine:** Truskavets (49.278°N 23.510°E), 16.VII.1980, Narchuk (1 ♂, ZISP).

DESCRIPTION. Male, female. Medium-sized flies (7.2–8.3 mm long).

Head. Frontal vitta and fronto-orbital plate yellow. Postcranium usually blackish in upper half and yellow in lower part, rarely yellow almost completely. 3–4 frontal setae present. Antenna yellow, usually darkened around base of arista. Postpedicel approximately 2 times as long as wide. Arista blackish, moderate haired: the length of hairs more than the width of basal diameter of arista.

Thorax usually black, grey dusted; sometimes scutum and pleural sclerites partly yellow. Scutum with the following paired setae: 2+3 dorsocentrals, a

pair of scapular setae (usually small), 1+2 supralars, 1 postpronotal, 2 notopleural (posterior seta small), 2 postalars. Anepisternum with 1 seta near posterior margin. Scutellum yellow or brown, delicately greyish dusted.

Legs entirely yellow, but usually mid and hind femora blackish dorsally. Fore femur with 7–8 long posteroventral and 6–9 short anteroventral setae. Fore tibia with 4 strong posteroventral and 5–6 strong anteroventral setae. Male mid femur with more or less dense hairs ventrally. Mid tibia with 1 anteroventral, 1 anterodorsal, 1–2 posterodorsal, 2–3 posteroventral and a ring of apical setae, in male additionally with long hairs ventrally. Hind tibia with 2–3 anterodorsal, 2–3 posterodorsal, 1 anteroventral, 1 preapical dorsal and 1 apical anteroventral setae.

Wing tinged with brownish. Calypters, margins of calypters, and halteres yellowish.

Abdomen black, greyish dusted. Female segments 7–8 shining. Male sternite 4 approximately as wide as long. Male sternite 5 with broad and short lobes covered with spinules inside (Fig. 8). Epandrium, cercal plate and surstyli as in Figs 20–22.

DISTRIBUTION. Russia: Moscow Oblast. — Europe (France, Germany, Ukraine) [Gorodkov, 1986; Ozerov, 2009].

Norellisoma caucasicum (Ozerov, 1993)
Figs 4, 9, 23–25.

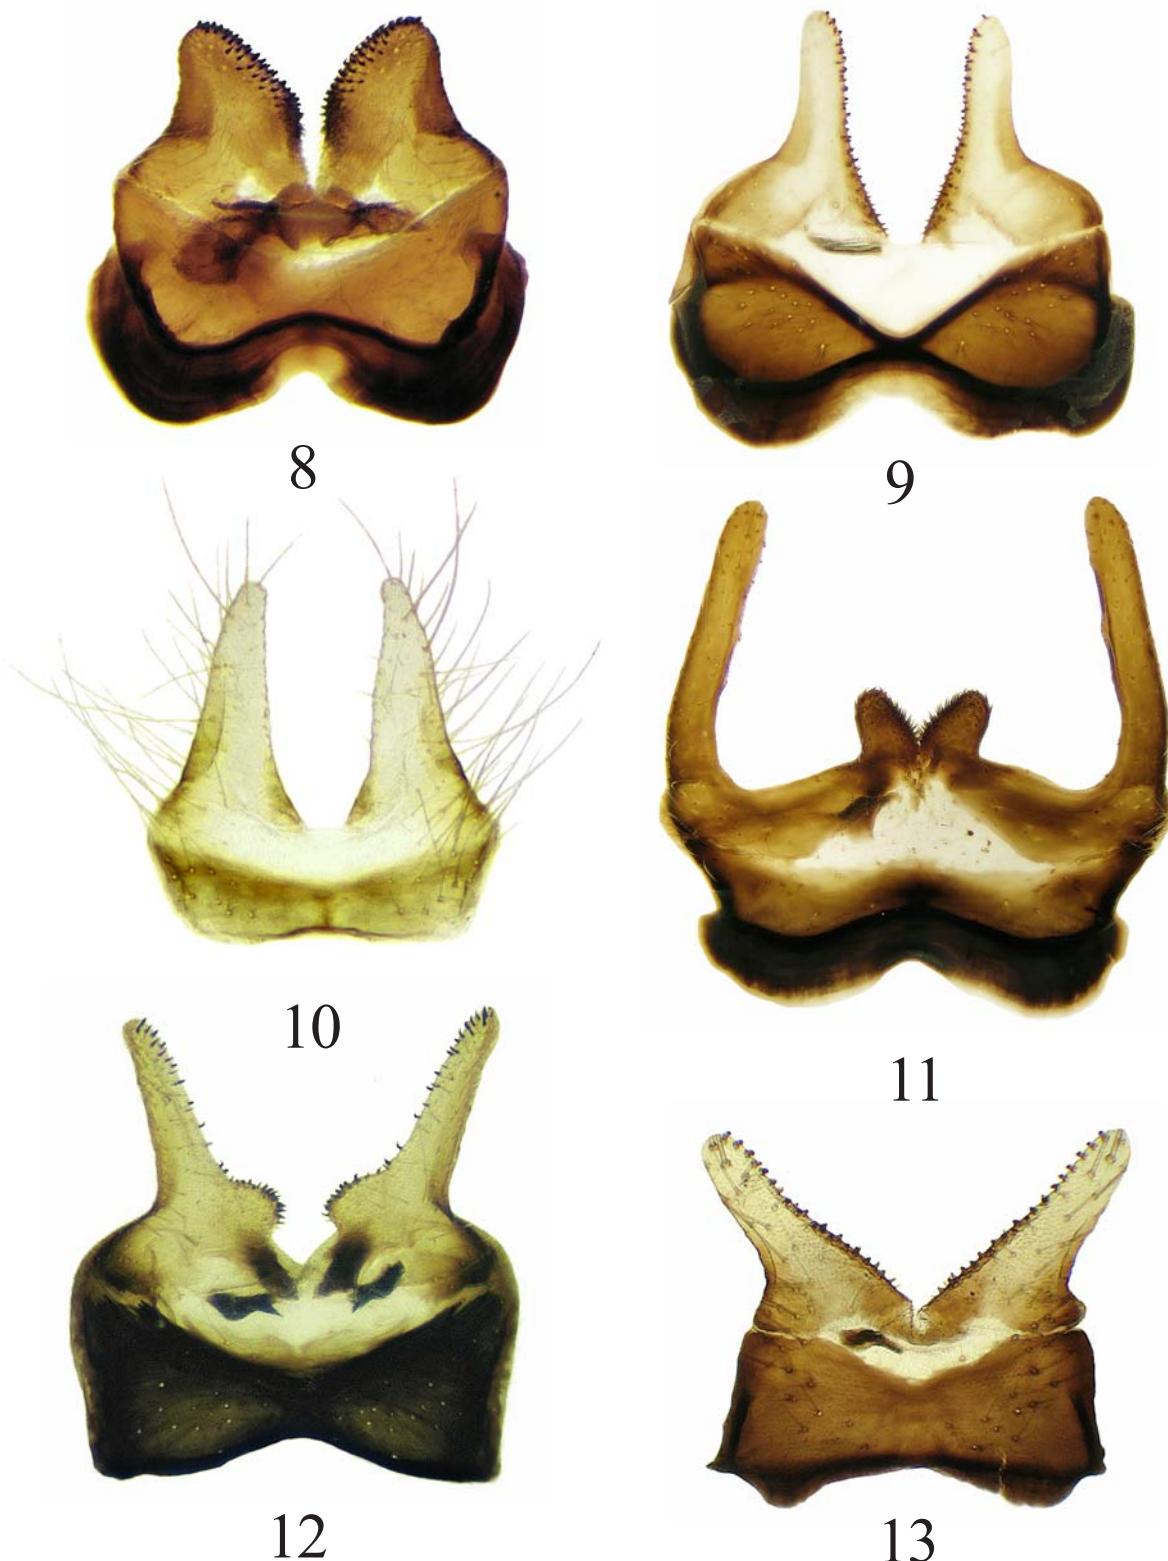

caucasicum Ozerov, 1993: 68 (*Norellia*). Type-locality: 10 km SE of Alagir, Bakhty Lapparyrag ridge, 1600 m (North Ossetia – Alania, Russia).

MATERIAL. **Altai:** Aktash env. (50.32°N 87.73°E), 2600 m, 6.VII.2016, N. Vikhrev (1 ♂, ZMUM); Seminsky pass, (51.0°N 85.5°E), 1650 m, 27–30.VI.2016, N. Vikhrev (3 ♀♀, ZMUM); **Karakay-Cherkessia:** Arkhyz (43.562°N 41.282°E), 14.VII.1939, D'yakonov, (1 ♂, ZISP); Teberdinskiy Reserve (43.443°N 41.737°E), 3–6.V.2000, K. Tomkovich (1 ♂, ZMUM); **Krasnodar Krai:** Teberdinskiy Reserve (ca. 43.443°N 41.738°E), 2700 m, 25–29.VI.1968, Gorodkov (5 ♂♂, 3 ♀♀, ZISP); Lagonaki (44.00°N 39.09°E), 1700 m, 11.VI.2012, 5–7.V.2013, N. Vikhrev (1 ♂, 1 ♀, ZMUM); Lagonaki (44.0°N 39.9°E), 1500–1900 m, 5–9.VI.2015, N. Vikhrev (3 ♂♂, 1 ♀, ZMUM); Estosadok env., Psekhanoko Mt. (43.691°N 40.366°E), 14–18.VI.2008, K. Tomkovich (5 ♂♂, 1 ♀, ZMUM); **North Ossetia – Alania:** Buron env. (43.793°N 43.922°E), 7.VI.1989, 4 and 13.VII.1990, A.L. Ozerov (3 ♂♂, ZMUM); Bakhty-Lapparyrag ridge (42.938°N 44.287°E), 1770 m, 29.VII.1988, 23–31.V.1989 and 28–30.VI.1990, A.L. Ozerov (14 ♂♂, 5 ♀♀, ZMUM); same place, 28–29.VI.1990, A. Shatalkin (3 ♂♂, ZMUM).

ADDITIONAL MATERIAL. **Azerbaijan:** Damir-Aparanchay River (41.066°N 47.933°E), 1600–1700 m, 15.VII.1994, M. Savitskiy (2 ♂♂, ZMUM); **Kazakhstan:** Katon-Karagay NP., Verkhnee Zimovye terrain env. (49.083°N 86.033°E), 26–27.VII.2010, O. Kosterin (1 ♂, 1 ♀, ZMUM).

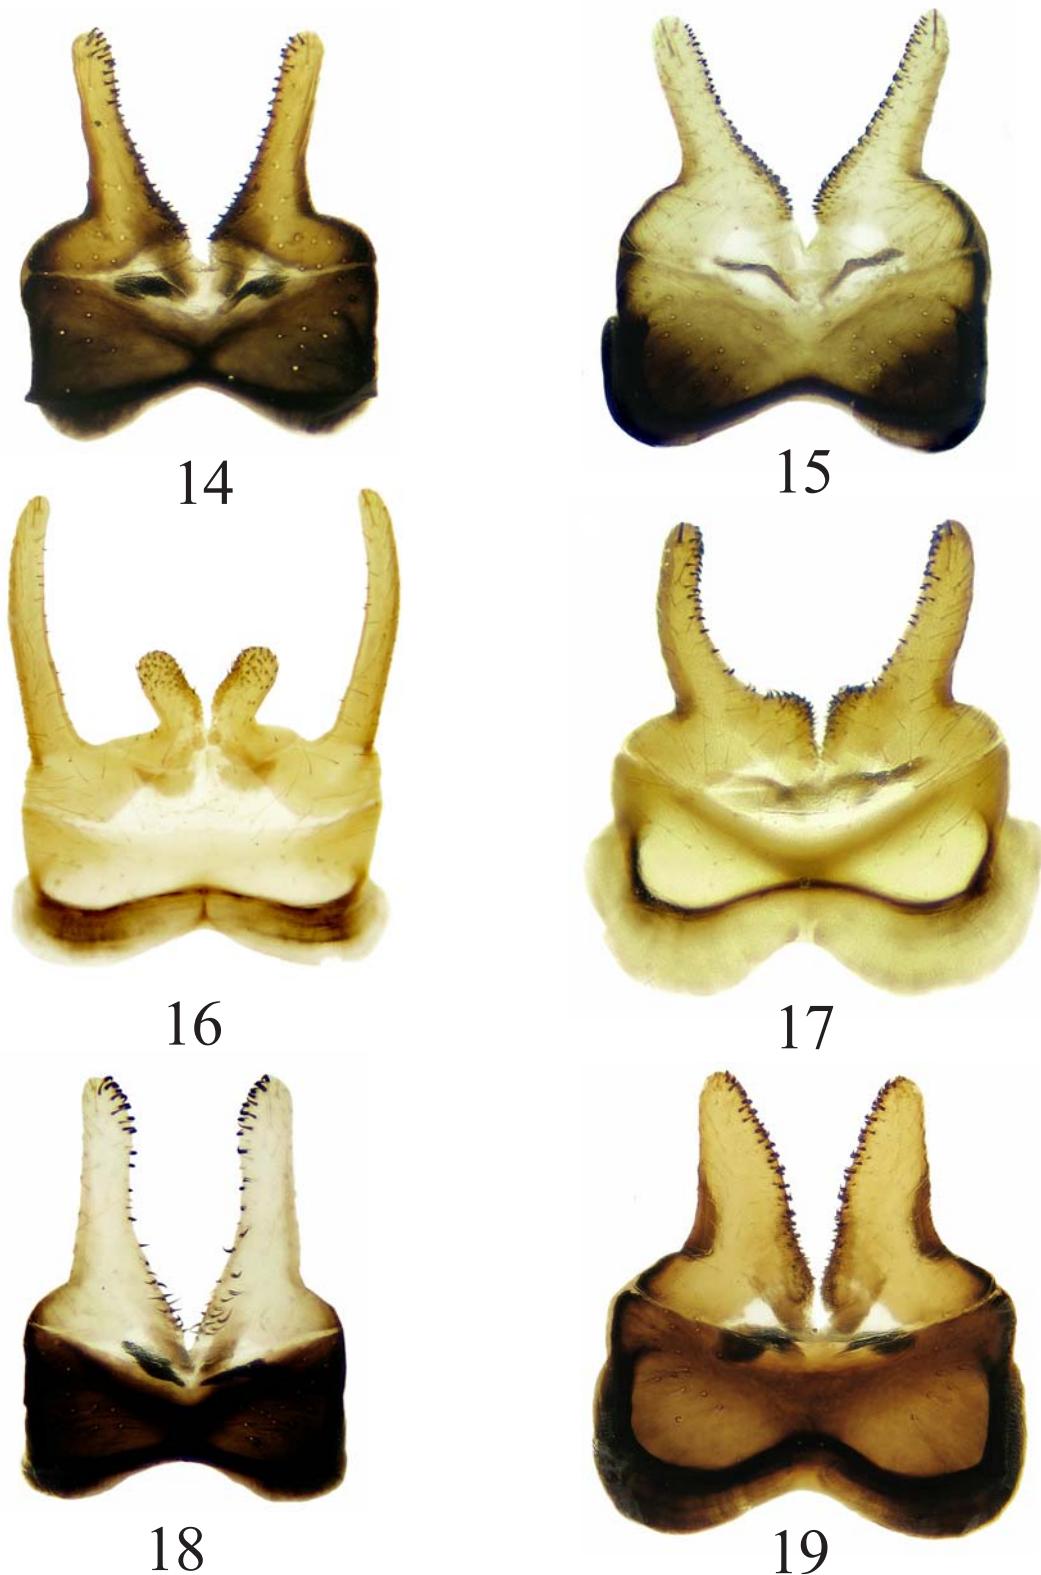

DESCRIPTION. Male, female. Small or medium-sized flies (3.8–5.6 mm long).

Head. Frontal vitta and fronto-orbital plate each yellow completely or blackish in upper half. Postcranium blackish (in male rarely yellow along lower margin). 2 frontal setae present. Antenna yellow completely in male, but in female postpedicel usually blackish on outside surface. Postpedicel approximately 2 times as long as wide. Arista blackish, short haired: the length

of hairs less than the width of basal diameter of arista.

Thorax and scutellum black, grey dusted. Scutum with the following paired setae: 2+2 dorsocentrals (anterior presutural seta usually small), 1+2 supra-alaris, 1 postpronotal, 2 notopleurals, 2 postalars. Anepisternum with 1–2 setae near posterior margin.

Legs yellow in ground color, but often (usually in female) darkened dorsally. Fore femur with 9–11 long posteroventral, 7–8 short anteroventral, 5–7 dorsal/posterodorsal setae. Fore tibia with 5 strong posteroventral and 5–7 strong anteroventral setae. Mid tibia with 2 anteroventral, 1–2 anterodorsal, 1–2 posterodorsal, 2–3 posteroventral and a ring of apical setae. Hind tibia with 2–3 anterodorsal, 2–3 posterodorsal, 1 anteroventral, 1 preapical dorsal and 1 apical anteroventral setae.

Wing tinged with brownish. Calypters, margins of calypters, and halteres yellowish.

Abdomen black, greyish dusted. Female segments 7–8 shining. Male sternite 4 wider than long (Fig. 4). Male sternite 5 with lobes broad basally and narrowed apically (Fig. 9). Epandrium, cercal plate and surstyli as in Figs 23–25.

DISTRIBUTION. Russia: Altai, Karachay-Cherkessia, Krasnodar Krai, North Ossetia – Alania. — Azerbaijan (**first record**), Kazakhstan (**first record**).

Norellisoma flavostriatum Ozerov, 2009
Figs 10, 26, 27.

flavostriatum Ozerov, 2009: 423 (*Norellisoma*). Type-locality: Estosadok env., Psekhako Mt. (43°41'28"N, 40°22'E) (Krasnodar Krai, Russia).

NOTE. This species is known only from the type-locality [Ozerov, 2009].

DESCRIPTION. Male. Length of body 4.8 mm.

Head. Frontal vitta and fronto-orbital plate yellow. Postcranium blackish in upper part, excluding yellow median occipital sclerite, and whitish in lower half. 2 frontal setae present. Antenna yellow. Postpedicel approximately 2 times as long as wide. Arista yellowish, moderate haired: the length of hairs more than the width of basal diameter of arista.

Thorax delicately greyish dusted. Scutum black with yellow stripe between dorsocentral setae. Lateral thoracic sclerites yellow, only anepimeron, katatergite, anatergite and mediotergite black. Scutum with the following paired setae: 1+1 dorsocentrals, 0+2 supra-alaris, postpronotals absent, 1 notopleural (anterior), 1 postalar. Anepisternum with 1 seta near posterior margin. Scutellum yellow, grey dusted.

Legs entirely yellow. Fore femur with 10–11 long and thin posteroventral, 9–12 short anteroventral, 4–5 dorsal/posterodorsal setae. Fore tibia with 7 strong posteroventral and 7–8 anteroventral setae. Mid tibia with 1 anteroventral, 1 anterodorsal, 2 posterodorsal setae, with a row of moderate long hairs posteroventrally, and a ring of apical setae. Hind tibia with 1–2 anterodorsal, 2 posterodorsal, 1 preapical dorsal and 1 apical anteroventral setae.

Wing tinged with whitish, darkened near apexes of veins R₂₊₃ and M₁. Calypters, margins of calypters, and halteres yellowish.

Abdomen black, greyish dusted. Male sternite 5 with conical lobes covered with long hairs (Fig. 10). Epandrium, cercal plate and surstyli as in Figs 26, 27.

Female unknown.

DISTRIBUTION. Russia: Krasnodar Krai.

Norellisoma insulare (Ozerov, 1993)
Figs 11, 28–30.

insulare Ozerov, 1993: 71 (*Norellia*). Type-locality: Kunashir I., environs of the Mendeleev volcano (Sakhalin Oblast, Russia).

NOTE. This species was recorded in Russia from Far East by Ozerov & Krivosheina [2014].

MATERIAL. *Sakhalin Oblast*: Kunashir I., cape Alekhinsky (43.918°N 145.526°E), 19–21.IX.2009, I. (48.870°N 144.60°E), 24.VIII.1973, Logvinovskiy (1 ♂, ZISP); Sakhalin I., Yuzhno-Sakhalinsk (46.954°N 142.736°E), 7.VI.1954, Violovich (5 ♂♂, 5 ♀♀, ZISP); Sakhalin I., Tymovo env. (51.128°N 142.675°E), 1.VI.1979, A. Veselkin (1 ♂, ZMUM).

DESCRIPTION. Male, female. Medium-sized flies (6.1–8.6 mm long).

Head. Frontal vitta and fronto-orbital plate yellow. Postcranium usually blackish in upper half and yellow in lower part, rarely yellow almost completely. 3–4 frontal setae present. Antenna yellow. Postpedicel approximately 2 times as long as wide. Arista blackish, moderately haired: the length of hairs more than the width of basal diameter of arista.

Thorax from yellow to blackish, delicately grey dusted. Scutum often yellow with two blackish stripes along dorsocentral lines or blackish completely between dorsocentral lines. Scutum with the following

paired setae: 2+3 dorsocentrals, a pair of scapular setae (usually small), 1+2 supra-alars, 1 postpronotal (rarely 2 setae), 2 notopleurals, 2 postalars. Anepisternum with 2–3 setae near posterior margin. Scutellum from yellow or blackish, delicately greyish dusted.

Legs entirely yellow, but usually mid and hind femora blackish dorsally near apex. Male femora and tibiae with hairs longer than in female. Fore femur with 8–9 long posteroventral and 8–11 short anteroventral setae. Fore tibia with 4 strong posteroventral and 5 strong anteroventral setae. Mid tibia with 1–2 anterodorsal, 1–2 posterodorsal and a ring of apical setae in both sexes, in male additionally with long pale hairs ventrally, in female with 1 anteroventral and 2–3 posteroventral setae. Hind tibia with 3–4 anterodorsal, 2–3 poste-rodorsal, 1 anteroventral, 1 preapical dorsal and 1 apical anteroventral setae.

Wing tinged with brownish. Calypters, margins of calypters, and halteres brownish.

Abdomen black, greyish dusted. Female segments 7–8 shining. Male sternite 4 wider than long. Male sternite 5 with narrow stick-like lateral lobes and two short median projections; length of median projection less than the distance between median projection and lateral lobe (Fig. 11). Epandrium, cercal plate and surstyli as in Figs 28–30.

DISTRIBUTION. Russia: Sakhalin Oblast. — Japan [Hironaga, Suwa, 2005].

Norellisoma lesiae (Becker, 1894)
Figs 12, 31–33.

lesiae Becker, 1894: 129 (*Norellia*). Type-locality: “Lesgia” [=Dagestan] (Russia).

NOTE. Noted by Gorodkov [1986] for European part of Russia from Caucasus, and from Georgia (without indicating specific locality).

MATERIAL. Karachay-Cherkessia: Dombay, valley of the Alibek River (43.291°N 41.594°E), 2500 m, 1.VII.1982, Narchuk (6 ♂♂, 3 ♀♀, ZISP); Klukhor River (ca. 43.250°N 41.834°E), 2200 m, 25.VII.1905, Kalishevskiy, (1 ♀, ZISP); Krasnodar Krai: Lagonaki (44.009°N 39.09°E), 1700 m, 23–30.VI.2011, 11.VI.2012, and 5–7.V.2013, N. ADDITIONAL MATERIAL. Abkhazia: Bagri-Yashta ridge (43.440°N 40.708°E), 2000 m, 2.VII.2009, A. Gusakov (1 ♀, ZMUM).

DESCRIPTION. Male, female. Medium-sized flies (4.8–8.2 mm long).

Head. Frontal vitta yellow; fronto-orbital plate yellow in lower part and blackish in upper half or third. Postcranium black in upper part and yellow in lower 1/3. 2 frontal setae present. Antenna yellow, but sometimes postpedicel in female partly blackish on outside surface. Postpedicel approximately 2 times as long as wide. Arista black, short haired: the length of hairs less than the width of basal diameter of arista.

Thorax and scutellum black, densely grey dusted. Scutum with the following paired setae: 2+2 dorsocentrals, 1+2 supra-alars, 1 postpronotal, 1 or 2 notopleurals (posterior usually small or absent), 2 postalars. Anepisternum with 1 setae near posterior margin.

Legs yellow, rarely fore and mid femora darkened dorsally in some females. Male femora and tibiae with hairs longer than in female. Fore femur with 7–10 long posteroventral and 6–9 short anteroventral setae. Fore tibia with 4 strong posteroventral and 5–6 strong anteroventral setae. Mid tibia with 1–2 anteroventral, 1 anterodorsal, 1–2 posterodorsal and a ring of apical setae in both sexes, in male additionally with long pale hairs ventrally, in female with 0–1 apical and 2–3 posteroventral setae. Hind femur with a row of black anterodorsal setae, with 1–3 anteroventral setae in apical quarter and 0–1 apical dorsal seta. Hind tibia with 2–3 anterodorsal, 2 posterodorsal, 1 preapical dorsal and 1 apical antero-ventral setae.

Wing tinged with brownish. Calypters, margins of calypters, and halteres yellowish.

Abdomen blackish, grey dusted. Female segments 7–8 shining. Male sternite 4 approximately as wide as long. Male sternite 5 with narrow diverging lateral lobes each broadened inside basally (Fig. 12). Epandrium, cercal plate and surstyli as in Figs 31–33.

DISTRIBUTION. Russia: Dagestan, Karachay-Cherkessia, North Ossetia – Alania, Krasnodar Krai). — Abkhazia (**first record**), Georgia.

ADDITIONAL MATERIAL. **Mongolia**: Kosogol Lake [=Khövsgöl] (ca. 51.633°N 100.549°E), 19.VI.1880, Potanin (3 ♂♂, 1 ♀, ZISP).

DESCRIPTION. Male, female. Medium-sized flies (5.0–7.8 mm long).

Head. Frontal vitta yellow; fronto-orbital plate yellow completely or blackish in upper half. Postcranium blackish in upper part and whitish in lower third. 2 frontal setae present. Antenna yellow. Postpedicel approximately 2 times as long as wide. Arista blackish, short haired: the length of hairs less (or equal) than the width of basal diameter of arista.

Thorax and scutellum black, grey dusted. Scutum with the following paired setae: (1–2)+2 dorsocentrals (anterior presutural seta small), 1+2 supra-alaris, 1 postpronotal, 1–2 notopleural (usually only anterior seta present, posterior seta always small), 2 postalars. Anepisternum with 1 seta near posterior margin.

Legs entirely yellow, only coxae of mid and hind legs partly darkened. Fore femur with 9–11 long posteroventral, 7–8 short anteroventral, 5–7 dorsal/posterodorsal setae. Fore tibia with 5 strong posteroventral and 5–7 strong anteroventral setae. Mid tibia with 1 anteroventral, 1 anterodorsal, 1–2 posterodorsal, 2–3 posteroventral and a ring of apical setae. Hind tibia with 1–3 anterodorsal, 1–2 posterodorsal, 1 preapical dorsal and 1 apical anteroventral setae; additionally with 1 anteroventral seta in apical quarter in female.

Wing tinged with brownish. Calypters, margins of calypters, and halteres yellowish.

Abdomen black, greyish dusted, often tergites shining laterally. Female segments 7–8 shining. Male sternite 4 wider than long. Male sternite 5 with triangular lateral lobes usually strong divergent (Fig. 13). Epandrum, cercal plate and surstyli as in Figs 34–36. Surstyli with bifurcate apex (Fig. 34), the width of apical lobes varying in different specimens.

DISTRIBUTION. Russia: Altai, Arkhangelsk Oblast, Bashkiria, Buryatia, Karachay-Cherkessia, Kare-

lia, Komi, Krasnodar Krai, Krasnoyarsk Krai, Lenigrad Oblast, Murmansk Oblast, Tuva, Tyumen' Oblast. — Europe (widespread) [Šifner, 2008], Mongolia [Gorodkov, 1986].

Norellisoma montanopratense (Ozerov, 1993)

Figs 14, 37–39.

montanopratensis Ozerov, 1993: 67 (*Norellia*). Type-locality: 10 km SE of Alagir, Bakhty Lapparyrag ridge, 1600 m (North Ossetia – Alania, Russia).

MATERIAL. **Krasnodar Krai**: Kishi River (44.057°N 40.172°E), 18.VI.1911, Volnukhin (2 ♂♂, ZISP); Estosadok, Psekha Mt., (43.691°N 40.366°E), 14–18.VI.2008, K. Tomkovich (1 ♂, ZMUM); Teberdinskiy reserve (43.447°N 41.741°E), 25 and 29.VI.1968, Gorodkov (2 ♂♂, 2 ♀♀, ZISP); **North Ossetia – Alania**: Bakhty-Lapparyrag ridge (42.938°N 44.287°E), 1770 m, 23.V.1989, A.L. Ozerov (1 ♂, 1 ♀, ZMUM).

ADDITIONAL MATERIAL. **Abkhazia**: Klukhorskiy pass, valley of the river Klych (ca. 43.2441°N 41.8669°E), 29.VI. and 2.VII.1968, Gorodkov (2 ♂♂, ZISP);

DESCRIPTION. Male, female. Small or medium-sized flies (3.5–4.8 mm long).

Head. Frontal vitta yellow in lower half and blackish in upper half; fronto-orbital plate blackish. Postcranium black. 2–3 frontal setae present. Antenna blackish in ground color, pedicel and postpedicel partly reddish. Postpedicel approximately 2 times as long as wide. Arista blackish, short haired: the length of hairs less than the width of basal diameter of arista.

Thorax and scutellum black, grey dusted. Scutum with the following paired setae: 2+2 dorsocentrals, 1+2 supra-alaris, 1 postpronotal, 1–2 notopleural (usually only anterior seta present, posterior seta always small), 2 postalars. Anepisternum with 1–3 setae near posterior margin.

Legs. Coxae and femora of all legs black; tibiae of all legs yellow or blackish; tarsi of all legs yellow. Fore femur with 8–9 long posteroventral, 6–7 short anteroventral, 5–7 dorsal/posterodorsal setae. Fore tibia with 4 strong posteroventral and 5–6 strong anteroventral setae. Mid tibia with 1 anterodorsal, 1–2 posterodorsal and a ring of apical setae in both sexes, additionally in female with 0–1 anteroventral, 2–3 posteroventral setae. Hind tibia with 2 anterodorsal, 1–2 posterodorsal, 1 preapical dorsal and 1 apical anteroventral setae; additionally in female with 1 anteroventral seta in apical quarter.

Wing tinged with brownish. Calypters, margins of calypters, and halteres yellowish.

Abdomen black, grey dusted. Female segment 7 greyish dusted, segment 8 shining. Male sternite 4 wider than long. Male sternite 5 with narrow slightly divergent lateral lobes (Fig. 14). Epandrum, cercal plate and surstyli as in Figs 37–39.

DISTRIBUTION. Russia: Krasnodar Krai, North Ossetia – Alania. — Abkhazia (**first record**).

ADDITIONAL MATERIAL. **Abkhazia:** Bagri-Yashta ridge (43.440°N 40.708°E), 2000 m, 2.VII.2009, A. Gusakov (3 ♂♂, 2 ♀♀, ZMUM); Achibakh ridge (43.419°N 40.6263°E), 1830 m, 24.VI.2009, A. Gusakov (2 ♂♂, 1 ♀, ZMUM), same place (43.418°N 40.5860°E), 2240 m, 26.VI.2009, A. Gusakov (1 ♂, ZMUM); ca. 2.3 km SE of Chedym Mt. (43.2938°N 41.0580°E), 1900 m, 1.VII.2012, A. Prosvirov (1 ♂, 1 ♀, ZMUM).

DESCRIPTION. Male, female. Small or medium-sized flies (3.8–7.2 mm long).

Head. Frontal vitta yellow; fronto-orbital plate yellow in lower part and blackish in upper half or third. Postcranium black in upper part and yellow in lower 1/3 or 1/4. 2–3 frontal setae (usually 2 setae only) present. Antenna yellow, but postpedicel in female usually blackish on outside surface. Postpedicel approximately 2 times as long as wide. Arista black, short haired: the length of hairs about the width of basal diameter of arista.

Thorax and scutellum black, greyish dusted. Scutum with the following paired setae: 2+3 dorsocentrals, 1+2 supra-alaris, 1 postpronotal, 2 notopleurals (posterior usually small), 2 postalars. Anepisternum with 1–2 setae near posterior margin.

Legs yellow in ground color, but often (usually in female) darkened dorsally. Male femora and tibiae with hairs longer than in female. Fore femur with 6–10 long posteroventral and 6–9 short anteroventral setae. Fore tibia with 4 strong posteroventral and 5–7 strong anteroventral setae. Mid tibia with 1 anteroventral, 1 anterodorsal, 1–2 posterodorsal and a ring of apical setae in both sexes, in male additionally with long pale hairs ventrally, in female with 2–3 posteroventral setae. Hind tibia with 2–3 anterodorsal, 2 posterodorsal, 1 preapical dorsal and 1 apical anteroventral setae.

Wing tinged with brownish. Calypters, margins of calypters, and halteres yellowish.

Abdomen blackish, greyish dusted. Female segments 7–8 subshining. Male sternite 4 wider than long. Male sternite 5 with narrow diverging lateral lobes (Fig. 15). Epandrium, cercal plate and surstyli as in Figs 40–42.

DISTRIBUTION. Russia: Adygea, Krasnodar Krai. — Abkhazia.

Norellisoma orientale (Ozerov, 1993)
Figs 16, 43–45.

orientalis Ozerov, 1993: 70 (*Norellia*). Type-locality: town Zeya (Amur Oblast, Russia).

NOTE. Recorded by Ozerov & Krivosheina [2014] for Russia from Far East.

MATERIAL. **Amur Oblast:** Nora River basin, Sorokoverstnaya Channel (52.528°N 129.965°E), 1.VIII.2006, E.M. Veselova, A.B. Ryvkin (1 ♀, ZMUM); Selemzha River (52.42119°N 129.93507°E), 8.VIII.2006, E.M. Veselova, A.B. Ryvkin (1 ♀, ZMUM); Zeyskiy re-

serve, cordon “52 km” (54.087°N 126.871°E), 10.VII.1981, A.L. Ozerov (5 ♂♂, ZMUM); riverhead of the Chapingou [= Krounovka] River, tributary of the Shufan [= Borisovka] River (ca. 43.615°N 131.541°E), 1.VII.1962, Nartshuk (1 ♂, ZISP).

DESCRIPTION. Male, female. Medium-sized flies (6.1–8.2 mm long).

Head. Frontal vitta and fronto-orbital plate yellow. Postcranium yellow. 3–4 frontal setae present. Antenna yellow. Postpedicel approximately 2.5 times as long as wide. Arista blackish, moderate haired: the length of hairs more than the width of basal diameter of arista.

Thorax yellow, delicately greyish dusted. Scutum with two blackish stripes along dorsocentral lines and with the following paired setae: 2+3 dorsocentrals, a pair of scapular setae (usually small), 1+2 supra-alaris, 1 postpronotal (rarely 2 setae), 2 notopleural, 2 postalars. Anepisternum with 1–2 setae near posterior margin. Scutellum yellow or blackish, delicately greyish dusted.

Legs entirely yellow, only mid and hind femora blackish dorsally near apex. Male femora and tibiae with hairs longer than in female. Fore femur with 8–10 long posteroventral and 7–9 short anteroventral setae. Fore tibia with 4 strong posteroventral and 5–6 strong anteroventral setae. Mid tibia with 1–2 anterodorsal, 1–2 postero-dorsal and a ring of apical setae in both sexes, in male additionally with long pale hairs ventrally, in female with 1 anteroventral and 2–3 posteroventral setae. Hind tibia with 2–3 anterodorsal, 3–4 posterodorsal, 1 anteroventral, 1 preapical dorsal and 1 apical anteroventral setae.

Wing tinged with brownish. Calypters, margins of calypters, and halteres yellow.

Abdomen yellowish or blackish, delicately greyish dusted. Female segments 7–8 shining. Male sternite 4 wider than long. Male sternite 5 with narrow stick-like lateral lobes and two short median projections; length of median projection more than the distance between median projection and lateral lobe (Fig. 16). Epandrium, cercal plate and surstyli as in Figs 43–45.

DISTRIBUTION. Russia: Amur Oblast, Krasnoyarsk Krai, Primorsky Krai.

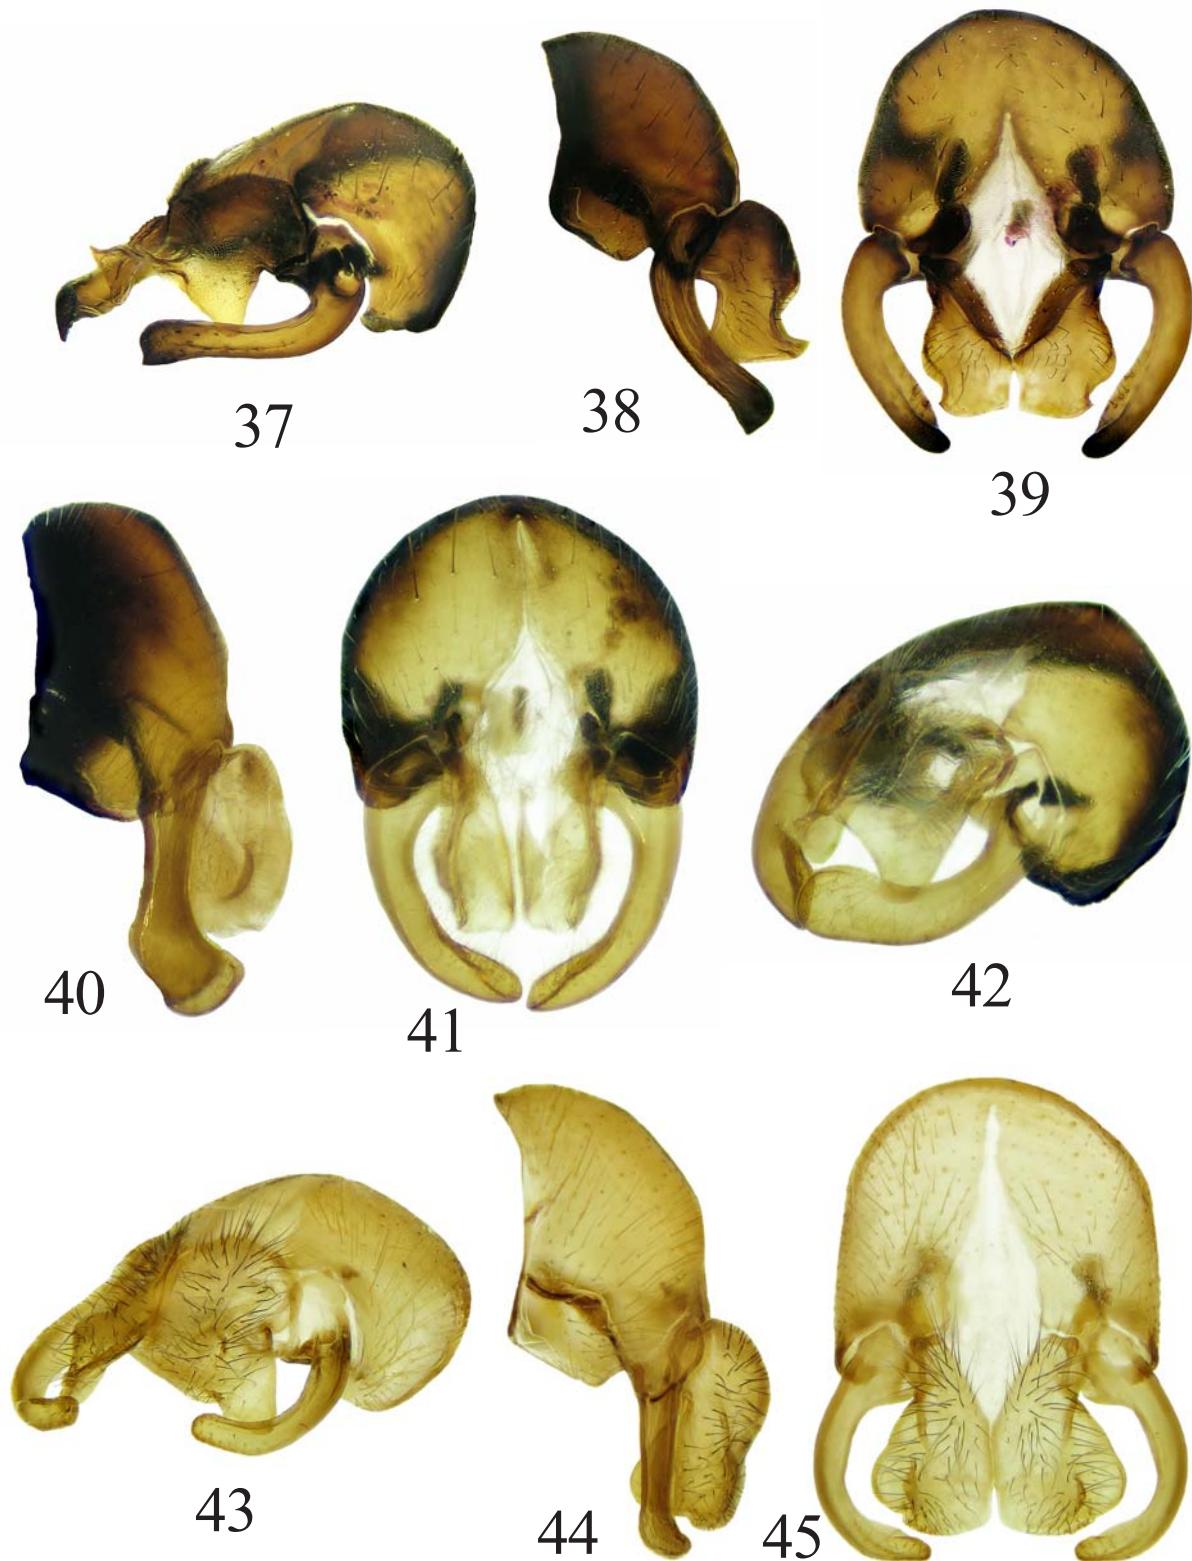

Norellisoma spinimanum (Fallén, 1819)
Figs 1, 2, 3, 5–7, 17, 46–48.

suilla Fabricius, 1794: 343 (*Musca*). Nomen oblitum. Type-locality: “Germania”.

spinimana Fallén, 1819: 7 (*Cordylura*). Type-locality: “Scania” (Skåne, Sweden).

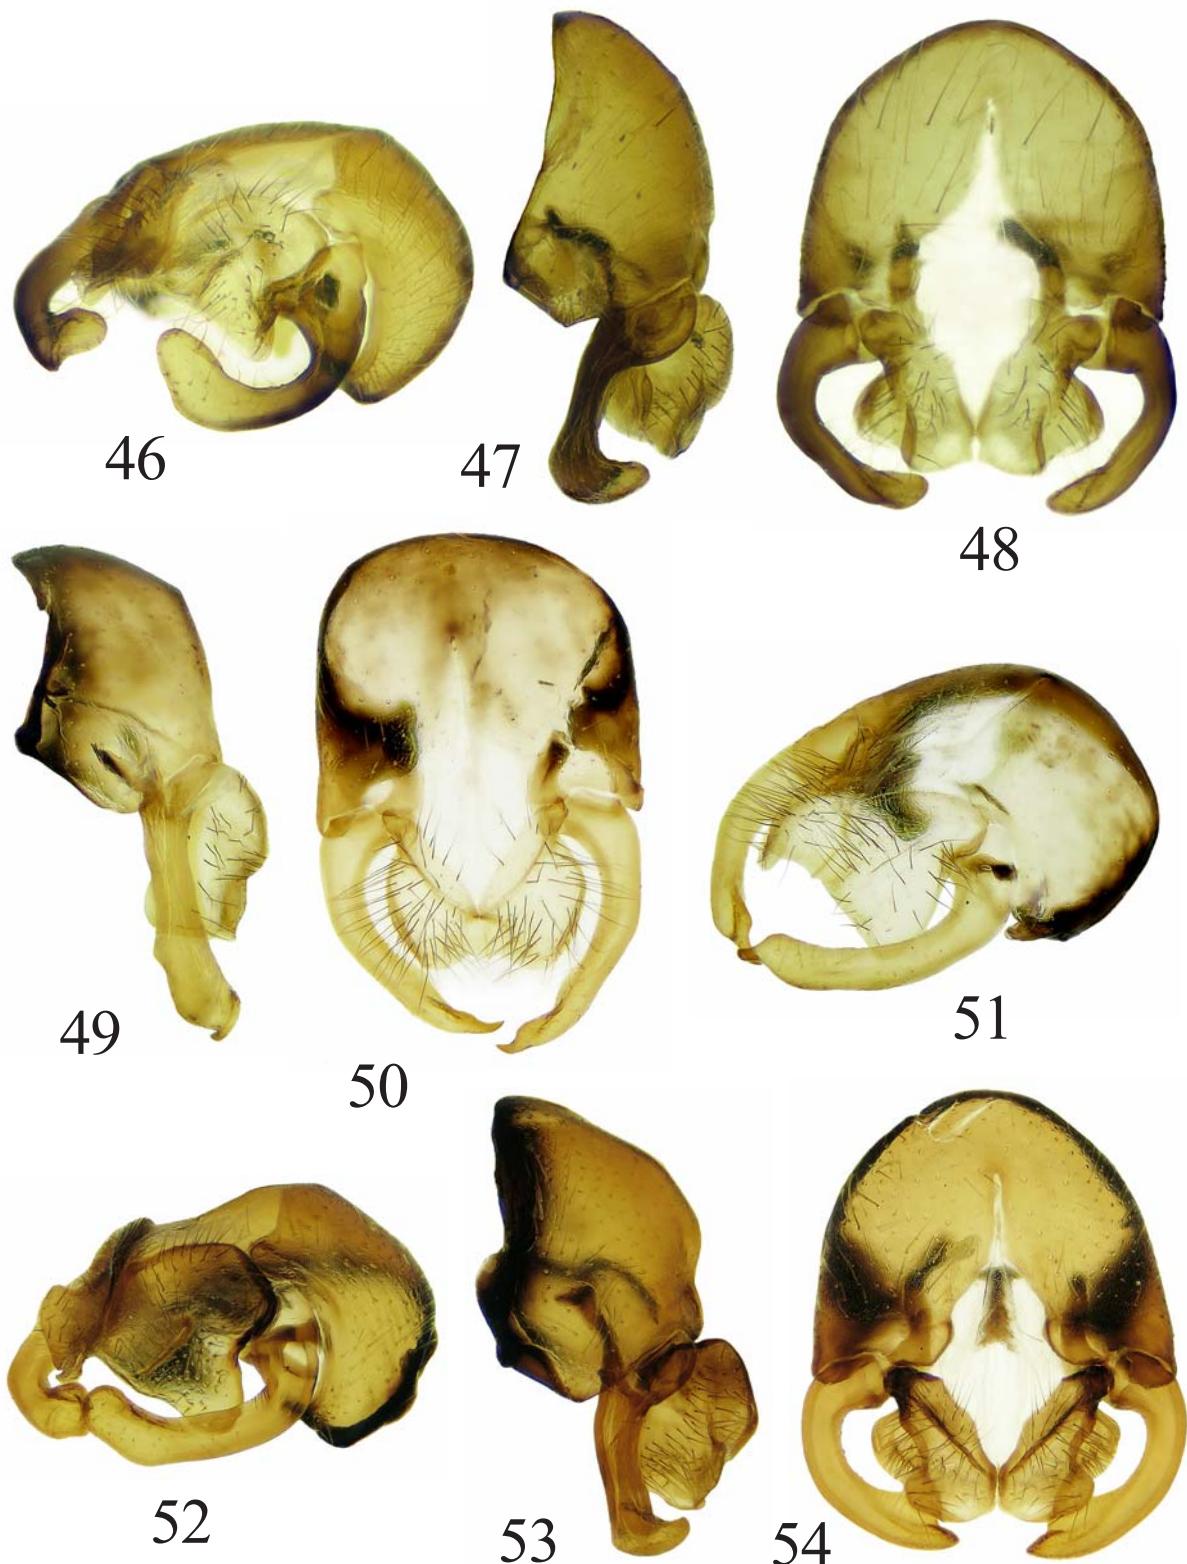

septentrionale Hendel, 1930: 2 (*Norelliosoma*). Type-locality: Petropavlovsk (Kamchatka, Russia).

NOTE. This species is widespread in Russia [Hendel, 1930; Gorodkov, 1970, 1986; Ovchinnikov, 2013; Ozerov, Krivosheina, 2014; Bagachanova *et al.*, 2016].

ADDITIONAL MATERIAL. **Kazakhstan**: Katarkol', 18 km SO of Borovoe Lake (52.946°N 70.431°E), 7 and 11.VIII.1937, L. Zimin (1 ♂, 1 ♀, ZISP).

DESCRIPTION. Male (Fig. 1), female. Medium-sized flies (5.0–7.8 mm long).

Head. Frontal and fronto-orbital plate yellow. Postcranium yellow completely or blackish in upper half. 3–4 frontal setae present. Antenna yellow. Postpedicel approximately 2 times as long as wide. Arista blackish, moderate haired: the length of hairs more than the width of basal diameter of arista.

Thorax yellow in ground color, delicately grey dusted. Scutum usually yellow with two blackish stripes along dorsocentral lines, rarely blackish completely between dorsocentral lines. Scutum with the following paired setae: 2+3 dorsocentrals, a pair of scapular setae (usually small), 1+2 supra-alars, 1 postpronotal, 2 notopleurals, 2 postalars. Anepisternum with 2–3 setae along posterior margin. Scutellum as in Fig. 3, yellow or brown, grey dusted.

Legs entirely yellow, sometimes apex of mid and hind femora blackish. Fore femur with 6–10 long posteroventral and 6–9 short anteroventral setae. Fore tibia with 4 strong posteroventral and 3–6 strong anteroventral setae (Fig. 2). Mid tibia with 1 anteroventral, 1 anterodorsal, 1–2 posterodorsal, 2–3 posteroventral and a ring of apical setae, in male additionally with pale hairs ventrally. Hind tibia with 2–3 anterodorsal, 2 posterodorsal, 1 preapical dorsal and 1 apical anteroventral setae.

Wing tinged with brownish. Calypters, margins of calypters, and halteres yellowish.

Abdomen brown or blackish, greyish dusted. Female segments 7–8 shining. Male sternite 4 rectangular, approximately as wide as long (Fig. 5). Male sternite 5 with narrow curved internally lateral lobes (Fig. 17). Epandrium, cercal plate and surstyli as in Figs 46–48.

DISTRIBUTION. Russia: Adygea, Altai, Amur Oblast, Arkhangelsk Oblast, Bashkiria, Buryatia, Chelyabinsk Oblast, Chuvashia, Crimea, Dagestan, Irkutsk Oblast, Kaliningrad Oblast, Kamchatka, Karelia, Kemerovo Oblast, Khabarovsk Krai, Komi, Krasnodar Krai, Krasnoyarsk Krai, Kursk Oblast, Leningrad Oblast, Lipetsk Oblast, Magadan Oblast, Mari El Republic, Moscow and Moscow Oblast, Murmansk Oblast, Nizhегород Oblast, North Ossetia – Alania, Novgorod Oblast, Novosibirsk Oblast, Omsk Oblast, Orenburg Oblast, Penza Oblast, Primorsky Krai, Pskov Oblast, Ryazan' Oblast, Smolensk Oblast, Tatarstan, Tula Oblast, Tuva, Tver' Oblast, Tyumen' Oblast, Vorohezh Oblast, Yaroslavl' Oblast, Zabaikalsky Krai. — Widespread in Europe [Šifner, 2008], Iran [Khaghaninia & Gharajedaghi, 2014], Kazakhstan (**first record**), Turkey [Eren, Ozerov, 2017], North America [Vockeroth, 1965].

Norellisoma tomkovichi Ozerov, 2010
Figs 18, 49–51.

tomkovichi Ozerov, 2010b: 158, 164 (*Norellisoma*). Type-locality: N Lagonaki mt., ~1830 m asl, 44.050°N 40.018°E (Adygea, Russia).

MATERIAL. **Krasnodar Krai**: Krasnaya Polyana (43.679°N 40.213°E), 25.VI.2011, N. Vikhrev (1 ♂, ZMUM); **North Ossetia – Alania**: Zaramag (42.696°N 43.999°E), 1900 m, 16.–18.VII.1988, A.L. Ozerov (1 ♀, ZMUM).

DESCRIPTION. Male, female. Medium-sized flies (4.3–5.2 mm long).

Head. Frontal vitta yellow; fronto-orbital plate yellow in lower half and blackish in upper half. Postcranium blackish in upper part and whitish in lower third. 2 frontal setae present. Antenna yellow. Postpedicel approximately 2 times as long as wide. Arista yellow, moderately haired: the length of hairs more than the width of basal diameter of arista.

Thorax and scutellum black, grey dusted. Scutum with the following paired setae: 1+2 dorsocentrals, 1+2 supra-alars, 0–1 postpronotal, 2 notopleurals, 2 postalars. Anepisternum with 1 seta near posterior margin.

Legs entirely yellow (coxae of mid and hind legs yellow). Fore femur with 8–9 long posteroventral, 6–9 short anteroventral, 6 dorsal/posterodorsal setae. Fore tibia with 4 strong posteroventral and 5–6 strong anteroventral setae. Mid tibia with 1 anterodorsal, 1 posterodorsal and a ring of apical setae in both sexes, in male additionally with long pale hairs ventrally, in female with 1 anteroventral and 1 posteroventral setae. Hind tibia with 1–2 anterodorsal, 1–2 posterodorsal, 1 preapical dorsal and 1 apical anteroventral setae.

Wing tinged with yellowish. Calypters, margins of calypters, and halteres yellowish.

Abdomen black, greyish dusted, but tergites shining laterally. Female segments 7–8 shining. Male sternite 4 approximately as wide as long. Male sternite 5 with long narrow parallel lateral lobes (Fig. 18). Epandrium, cercal plate and surstyli as in Figs 49–51.

DISTRIBUTION. Russia: Adygea, Krasnodar Krai, North Ossetia – Alania.

Norellisoma yolduense (Ozerov, 2008)
Figs 19, 52–54.

yolduensis Ozerov, 2008: 3 (*Norellia*). Type-locality: 45 km E of Ust'-Ulagan (50.5°N, 88.57°E) (Altai, Russia).

NOTE. This species was known only from the type-locality.

MATERIAL. **Altai**: Kosh-Agach, Kurayskiy ridge, 2500–2700 m, (50.3°N 87.7°E), 3.VII.2008, A. Barkalov (6 ♂♂, 1 ♀, ISEA and ZMUM).

DESCRIPTION. Male, female. Medium-sized flies (6.4–6.8 mm long).

Head. Frontal vitta yellow; fronto-orbital plate yellow. Postcranium usually blackish in upper half and yellow in lower part, rarely yellow almost completely. 3–4 frontal setae present. Antenna yellow. Postpedicel approximately 2 times as long as wide. Arista blackish, short haired: the length of hairs about the width of basal diameter of arista.

Thorax and scutellum from yellow to blackish, delicately grey dusted. Scutum often yellow with two blackish stripes along dorsocentral lines or blackish completely between dorsocentral lines. Scutum with the following paired setae: 2+3 dorsocentrals, a pair of scapular setae (usually small), 1+2 supra-alars, 1 postpronotal, 2 notopleurals (posterior seta small), 2 postalars. Anepisternum with 2–3 setae near posterior margin.

Legs yellow, but usually mid and hind femora blackish dorsally near apex. Fore femur with 8–9 long posteroventral and 6–9 short anteroventral setae. Fore tibia with 4 strong posteroventral and 5–6 strong anteroventral setae. Mid tibia with 1 anteroventral, 1 anterodorsal, 1–2 posterodorsal, 2–3 posteroventral and a ring of apical setae. Hind tibia with 2–3 anterodorsal, 2–3 posterodorsal, 1 anteroventral, 1 preapical dorsal and 1 apical anteroventral setae.

Wing tinged with brownish. Calypters, margins of calypters, and halteres brownish.

Abdomen black, greyish dusted. Female segments 7–8 shining. Male sternite 4 approximately as wide as long. Male sternite 5 with broad triangular lateral lobes (Fig. 19). Epandrium, cercal plate and surstyli as in Figs 52–54.

DISTRIBUTION. Russia: Altai.

KEY TO THE SPECIES OF *NORELLISOMA* WAHLGREN OF RUSSIA

1. Scutum with one pair of postsutural dorsocentral setae. Scutum black with yellow stripe between dorsocentral setae. Male sternite 5, epandrium, cercal plate and surstyli as in Figs 10, 26, 27 *N. flavostriatum* Ozerov
- Scutum with 2 or 3 pairs of postsutural dorsocentral setae 2
2. Scutum with 2 pairs of postsutural dorsocentral setae 3
- Scutum with 3 pairs of postsutural dorsocentral setae 7
3. Fore coxa black. Femora of all legs completely black. Male sternite 5, epandrium, cercal plate and surstyli as in Figs 14, 37–39 *N. montanopratense* (Ozerov)
- Fore coxa yellow. Femora of all legs yellow completely or darkened dorsally only 4
4. Postcranium black completely. Male sternite 5, epandrium, cercal plate and surstyli as in Figs 9, 23–25 *N. caucasicum* (Ozerov)
- Postcranium yellow in lower third or half 5
5. Fore tibia with 5 strong posteroventral setae. Male sternite 5, epandrium, cercal plate and surstyli as in Figs 13, 34–36 *N. lituratum* (Meigén)
- Fore tibia with 4 strong posteroventral setae 6
6. Thorax and scutellum black, densely grey dusted. Abdominal tergites 1–6 densely grey dusted. Height of gena below eye more than the width of postpedicel. Female sternite 6 with strong black setae near posterior margin. Male sternite 5, epandrium, cercal plate and surstyli as in Figs 12, 31–33 *N. lesiae* Becker
- Thorax and scutellum delicately grey dusted. Abdominal tergites 1–6 shining laterally. Height of gena below eye less than the width of postpedicel. Female sternite 6 with thin setae near posterior margin. Male sternite 5, epandrium, cercal plate and surstyli as in Figs 18, 49–51 *N. tomkovichii* Ozerov
7. Male sternite 5 with a pair of short median projections on posterior margin (Figs 11, 16) 8
- Male sternite 5 without median projections on posterior margin (Figs 8, 19) 9
8. Length of median projection of male sternite 5 less than the distance between median projection and lateral lobe (Fig. 11). Epandrium, cercal plate and surstyli as in Figs 28–30 *N. insulare* (Ozerov)
- Length of median projection of male sternite 5 more than the distance between median projection and lateral lobe (Fig. 16). Epandrium, cercal plate and surstyli as in Figs 43–45 *N. orientale* (Ozerov)
9. Male sternite 5 with short lateral lobes (Fig. 8). Epandrium, cercal plate and surstyli as in Figs 20–22 *N. armipes* (Meigén)
- Male sternite 5 with long lateral lobes (Fig. 19). Epandrium, cercal plate and surstyli as in Figs 52–54 *N. yolduense* (Ozerov)

Acknowledgements. We are very grateful to Dr. Olga Ovchinnikova (ZISP) and Mrs. Galina Suleymanova (ZISP) for the loan of the material of Scathophagidae for study. The investigation was fulfilled within the state project No AAAA-A16-116021660077-3 (A.L. Ozerov).
