KEY WORDS: Spider, cribellate, new species, distribution, taxonomy, Naxçývan, Turkey, Iran.

КЛЮЧЕВЫЕ СЛОВА: Паук, крибеллятный, новый вид, распространение, таксономия, Нахичевань, Турция, Иран.

**ABSTRACT.** A survey of *Filstata* Latreille, 1810 occurring in the Middle East is provided. Two species occur in region: the trans-Mediterranean *F. insidiatrix* (Forsskål, 1775) and the new species, *F. lehtineni* sp.n., from Azerbaijan. The two species are illustrated and a detailed description is provided for the new species. The distribution of *F. insidiatrix* is briefly discussed and a map showing the ranges of both species is presented.

**РЕЗЮМЕ.** Сделан обзор пауков рода *Filstata* Latreille, 1810 Передней Азии. В регионе выявлены два вида: транссредиземноморский *F. insidiatrix* (Forsskål, 1775) и новый вид, *F. lehtineni* sp.n., из Азербайджана. Оба вида проиллюстрированы и новый вид подробно описан. Обсуждено вкратце распространение *F. insidiatrix* и приведена карта с распространением обоих видов.

#### Introduction

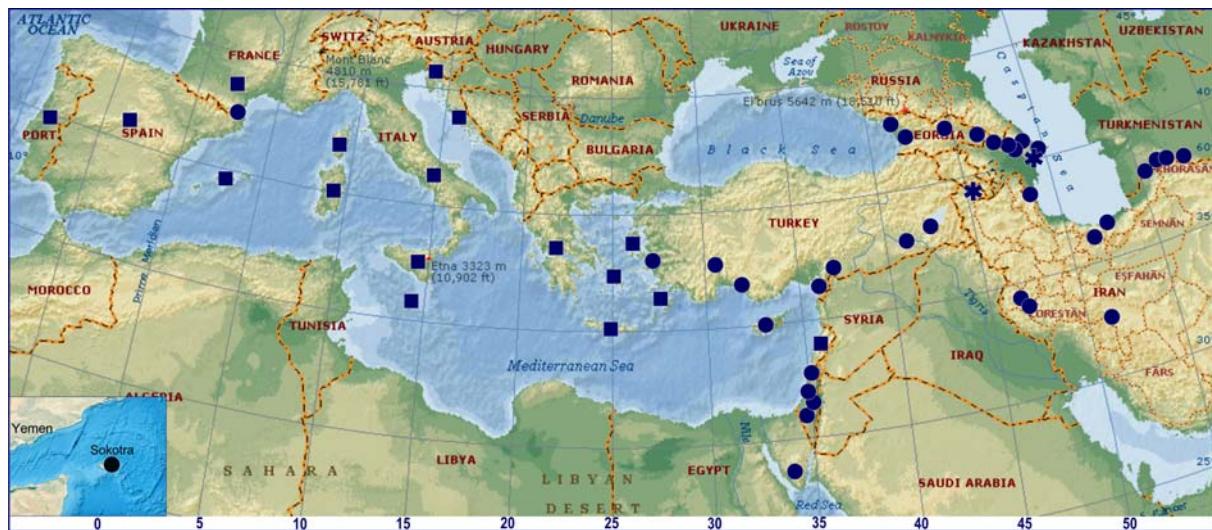

Currently *Filstata* Latreille, 1810, with 18 valid species, is second largest genus of the family Filistatidae [Platnick, 2014]. Only *Pritha* Lehtinen, 1967 has more species (20) [Platnick, 2014]. Most species of *Filstata* are known from the southern Palaearctic (from the Canary Islands to Japan), although three species are known outside of the Palaearctic: Mexico, India and Christmas Island [cf. Platnick, 2014]. The genus is rather poorly studied and has not been the subject of a large scale taxonomic revision. The majority of species (10) are known from a single taxonomic entry, another four species are known from only two entries [cf. Platnick, 2014]. Eight species are known from a single sex, either the female (seven species) or the male (one spe-

cies). Species known only from females lack illustrations of the endogyn. The largest contribution to the taxonomy of the genus was made by Wunderlich, who revised *Filstata* of the Canary Islands and also, in part, the south Mediterranean taxa [Wunderlich, 1992, 1995]. Judging from the original descriptions (indication of size, position of spinnerets, shape of the male palp, etc.) and the study of some types, the species that occur outside of the Mediterranean are likely misplaced in the genus.

Only one species of the genus, *F. insidiatrix* (Forsskål, 1775), has a wide range and occurs from the Iberian Peninsula to Turkmenistan [Helsdingen, 2013; Mikhailov, 2013]. Other species are known from either their type locality only, or from a few additional nearby regions. The highest species diversity of the genus is observed in the Mediterranean (nine) [cf. Helsdingen, 2013], and within this region the highest diversity occurs in Macaronesia (five species). The eastern Mediterranean harbors only three species: *F. annulipes* Kulczyński, 1908, *F. insidiatrix* and *F. puta* O. Pickard-Cambridge, 1876 [Mikhailov, 2013; Platnick, 2014]. While surveying the fauna of Azerbaijan, the senior author collected *F. insidiatrix* and another unidentifiable species. The main goals of this paper are as follows: 1) to describe the new species in detail and 2) to clarify the distribution of *F. insidiatrix*.

#### Material and methods

Photographs were taken using an Olympus E-520 camera attached to an Olympus SZX16 stereomicroscope, and prepared using CombineZP image stacking software. Epigynes were cleared in a KOH/water solution. Photographs were taken with the specimens se-

Map 1. Distribution records of *Filistata insidiatrix* (■●) and *F. lehtineni* sp.n. (\*).

Square (■) refers to state or island record in Helsdingen [2013] and circle (●) refers to examined material (by us or our colleagues).

Карта 1. Распространение *Filistata insidiatrix* (■●) и *F. lehtineni* sp.n. (\*).

Квадратом (■) отмечены страны или острова где встречается вид согласно Helsdingen [2013] и кружком (●) отмечены локалитеты из которых мы или наши коллеги исследовали материал.

cured in dishes with paraffin on bottom. Measurements were made to an accuracy of 0.01 mm. Lengths of leg and palp segments were measured on the dorsal side, from the midpoint of the anterior margin to the midpoint of the posterior margin. All measurements are given in millimetres.

Specimens from the following spider collections were studied: HUJ — Hebrew University, Jerusalem, Israel; MMUM — Manchester Museum, the University of Manchester; TAU — Department of Zoology, Tel-Aviv University, Israel; ZMMU — Zoological Museum of the Moscow State University, Russia; ZMUT — Zoological Museum, University of Turku, Finland.

The abbreviations used in the text are as follows. Eyes: ALE — anterior lateral; AME — anterior median; PLE — posterior lateral; PME — posterior median. Leg and palp segments: F — femur; M — metatarsus; T — tibia. Spines and their position: d — dorsal; p — prolateral; r — retrolateral; v — ventral.

## Taxonomy

### *Filistata* Latreille, 1810

#### *Filistata* Latreille, 1810: 121.

Type species: *Filistata testacea* Latreille, 1810 (= *Aranea insidiatrix* Forsskål, 1775) by monotypy.

#### *Filistata insidiatrix* (Forsskål, 1775)

(ZMMU), same locality, 21–29.05.2003 (Y.M. Marusik). TURKMENISTAN: 2 ♀♀ subad. (ZMMU), foothills of North-Western Kopetdag Mts., Kov-Ata Cave in surroundings of Bakharden (38°26'N 57°26'E), 18.07.1929 (J.P. Vlasov); 1 ♀ subad., 3 juv. (ZMMU), same locality, 4–

5.02.1982 (K.G. Mikhailov); 1 ♀, 1 juv. (ZMMU), South-Western Kopetdag Mts., Kara-Kala, 400 m, 15.07.1985 (V.Y. Fet). YEMEN: 1 ♀ (TAU), Socotra Isl., Diksam Plateau (12°30'N 53°59'E), 16.06.2009 (V. Hula).

**DIAGNOSIS.** *Filistata insidiatrix* differs from other Mediterranean congeners by the following characters:

— from *F. puta* and *F. lehtineni* sp.n. it can be distinguished by having a different configuration of the eye group, embolus and the spermathecae (*cf.* Figs. 7–8, 15–16, 19–22, 25–27 & Wunderlich, 1995, fig. 2–4); from the former species it differs also by its more intensive (not uniformly pale) coloration;

— from *F. annulipes* it differs in being larger (> 5 mm in *F. insidiatrix* and 5 < in *F. annulipes*) and in

Figs 7–10. Carapace and eyes of *Filistata insidiatrix* (7–8) and *F. lehtineni* sp.n. (9–10): 7, 9 — female; 8, 10 — male.

Рис. 7–10. Карапакс и глаза *Filistata insidiatrix* (7–8) и *F. lehtineni* sp.n. (9–10): 7, 9 — самка; 8, 10 — самец.

having uniformly coloured legs lacking darker fasciae;

— from *F. canariensis* Schmidt, 1976, *F. gomerensis* Wunderlich, 1992, *F. pseudogomerensis* Wunderlich, 1992, *F. teidensis* Wunderlich, 1992 and *F. tenerifensis* Wunderlich, 1992 this species differs by having a noticeably longer cymbium and embolus [cf. Wunderlich, 1992: figs 130–140].

Based on these characters, *F. insidiatrix* can be identified and distinguished from all other *Filistata* species, even in the juvenile stage.

**DESCRIPTION.** Well described by Brignoli [1982].

**DISTRIBUTION.** *Filistata insidiatrix* is known from the Iberian Peninsula [Helsdingen, 2013] through all of the northern Mediterranean countries to Turkmenistan [Mikhailov, 2013] (Map 1). All records of this species from Macaronesia seem to refer to another species [cf. Wunderlich, 1992: 312].

**HABITATS.** The species occurs within a wide scope of natural biotopes — from semideserts to true broad-leaved forest areas; it is also widely known as a synanthropic species [Brignoli, 1982]. In south Azerbaijan it was collected from the wall of a log house. In Turkey (Alanya Prov.) it was seen in great numbers on the roof and walls of a small stony grotto and among small clay-sandy piles. In the surroundings of Haifa the species

was collected within the forest and from the crevices of a stony cliff.

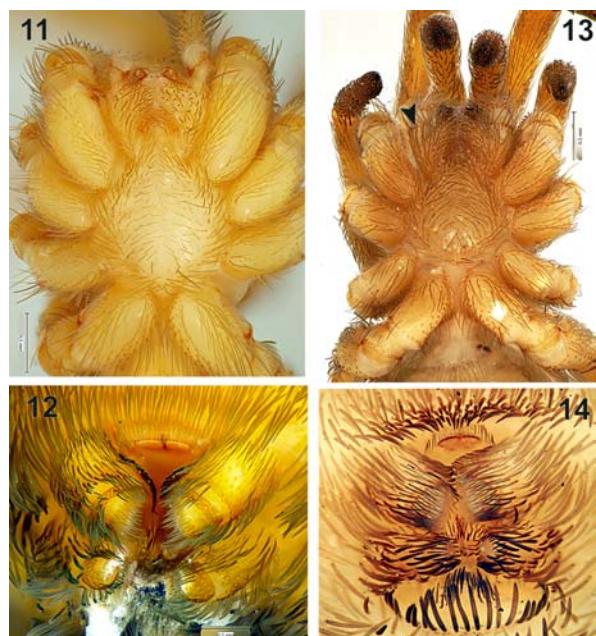

***Filistata lehtineni* sp.n.**  
Figs 4–6, 9–10, 13–14, 17–18, 23–24, 28–29, Map 1.

**TYPES.** Holotype ♂ (ZMMU): AZERBAIJAN, Naxçıvan, Dasharkh Vill., 39°33'629"N 45°02'53"E, 870 m, 1.06.2003 (Y.M. Marusik). Paratypes: 1 ♀ (ZMMU), same data as holotype; 2 ♀♀, 1 juv. (ZMMU), CE Azerbaijan, Gobustan, stony semidesert, 40°07'N 49°23'E, ~ 150 m, 17–31.05.2003 (Y.M. Marusik).

**ETYMOLOGY.** The species is named after our friend and senior colleague Pekka T. Lehtinen in honour of his profound studies on the systematics of spiders and on occasion of his 80<sup>th</sup> birthday.

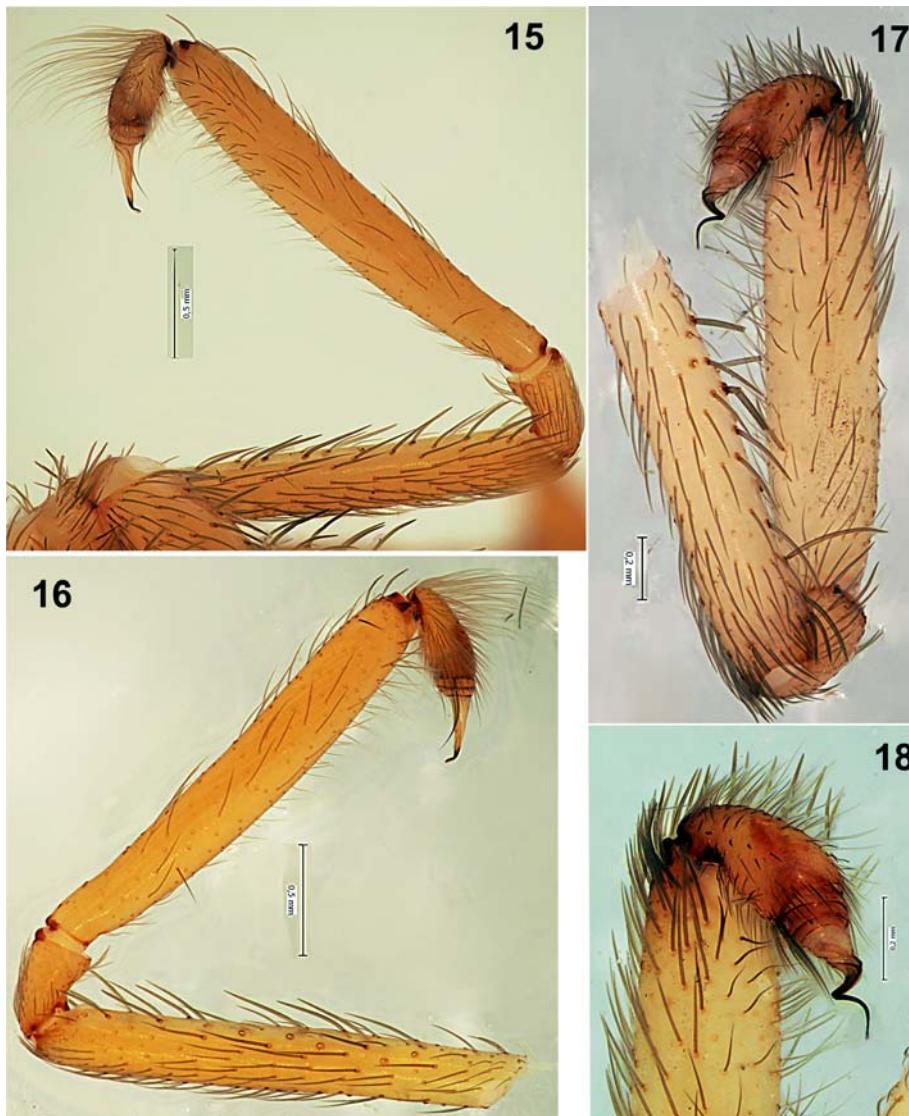

**DIAGNOSIS.** Males of the new species differ from all other *Filistata* species by having a screwed embolus (Figs. 17–18, 23–24). Both sexes of *F. lehtineni* sp.n. clearly differ from the sympatric *F. insidiatrix* by having a uniformly dark clypeus (the clypeus has a light median band in *F. insidiatrix*) (cf. Figs 7–10). The males of the two species have distinctly different palps: distinct spines on palpal femur, short tibia, dorsal setae of cymbium shorter than cymbium and screwed embolus in the new species, whereas *F. insidiatrix* has a femur lacking spines, a long and thin tibia, very long dorsal setae on the cymbium (longer than cymbium), and a straight embolus with a bent tip. Females of *F. lehtineni* sp.n. have smaller receptacles (Figs 28–30) than the sympatric *F. insidiatrix* (Figs 25–27).

**DESCRIPTION:** Male (holotype). Total length 5.38. Carapace 2.16 long, 1.72 wide. Body light yellowish-

Figs 11–14. Ventral view of female prosoma and spinnerets of *Filistata insidiatrix* (11–12) and *F. lehtineni* sp.n. (13–14): 11, 13 — prosoma; 12, 14 — spinnerets.

Рис. 11–14. Головогрудь и паутинные бородавки *Filistata insidiatrix* (11–12) и *F. lehtineni* sp.n. (13–14) снизу: 11, 13 — головогрудь; 12, 14 — бородавки.

Figs 15–18. Male palp of *Filistata insidiatrix* (15–16) and *F. lehtineni* sp.n. (17–18): 15, 17 — retrrolateral, 16, 18 — prolateral.

Рис. 15–18. Пальпа самца *Filistata insidiatrix* (15–16) и *F. lehtineni* sp.n. (17–18): 15, 17 — ретролатерально; 16, 18 — пролатерально.

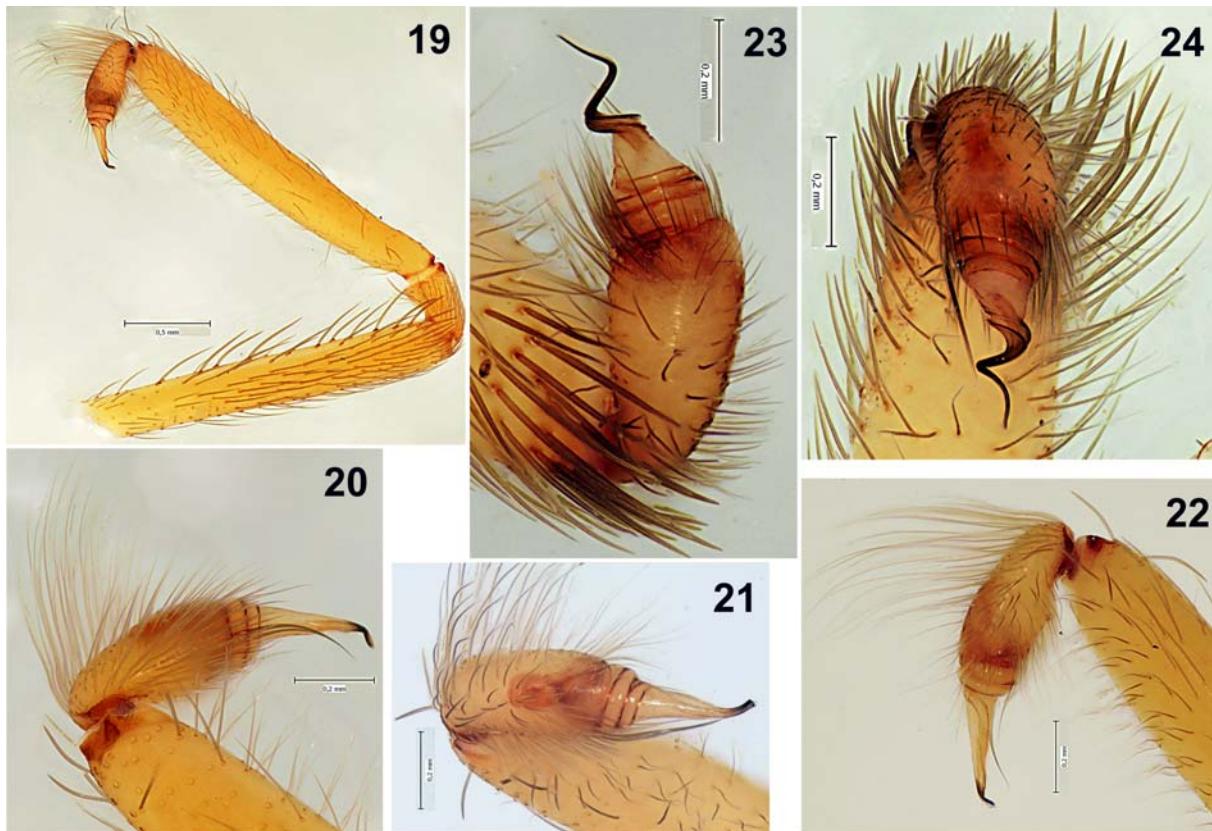

brown; legs and abdomen uniformly coloured; carapace with dark brown pattern including eye tubercle, postocular area, narrowly marked thoracic fovea and margins. Eye tubercle (Fig. 10) low. Eye diameters: AME 0.08, ALE 0.15, PLE 0.13, PME 0.11. Interdistance AME-AME 0.06. Leg measurements as shown in the table. Palp aspinose. Leg spination: femora: FI d1—0–0, p0–4(5)–1, r0–0–1, FII d1—0–0, p0–0–1, FIII d1—0(1)–0, p0–0–1; FIV d1—0–0, p0–0–1, r0–0–1; tibiae: TI p0–0–1–1–1, r0–0–1, v0–1–0, r0–0–1; TII p0–1–1–1; TIII p0–0–1, v1–1–1(2); TIV p0–0–1, r0–1–2;

metatarsi: MI p0–1–1–0, v2–2–2(3); MII p0–1–0, v2–2–3; MIII p0–1–1, v2–2–2–3(4); MIV p0–0–1, v2–2–2–4; other segments aspinose.

Palp as in Figs 17–18, 23–34. Femur with distinct ventral spines; tibia wider than femur, tibia relatively short (2.4 times longer than cymbium+bulbus); cymbium with short hairs (not longer than cymbium and even shorter than diameter of cymbium), prolateral setae weak; bulbus conical, relatively short; embolus with distinct base, screwed.

Length of leg joints in holotype ♂ and paratype ♀ (in parentheses):

	Femur	Patella	Tibia	Metatarsus	Tarsus	Total
Palp	1.49 (1.08)	0.46 (0.52)	1.48 (0.65)	—	0.39 (0.92)	3.82 (3.17)
I	2.97 (2.27)	0.95 (0.79)	3.38 (2.05)	3.46 (1.92)	1.70 (1.36)	12.46 (8.39)
II	2.58 (1.71)	0.93 (0.63)	2.37 (1.29)	2.37 (1.28)	1.39 (0.89)	9.64 (5.80)
III	2.20 (1.50)	0.72 (0.62)	2.20 (0.96)	2.39 (0.96)	1.22 (0.67)	8.73 (4.71)
IV	3.06 (1.97)	0.95 (0.80)	2.73 (1.24)	3.04 (1.26)	1.45 (0.87)	11.23 (6.14)

Figs 19–24. Male palp of *Filistata insidiatrix* (19–22) and *F. lehtineni* sp.n. (23–24): 19 — whole palp, retrolateral; 20–22 — terminal part of palp, prolateral, subapical and retrolateral; 23–24 — terminal part of palp, retrolateral and apical.

Рис. 19–24. Пальпа самца *Filistata insidiatrix* (19–22) и *F. lehtineni* sp.n. (23–24): 19 — вся пальпа, ретролатерально; 20–22 — дистальная часть пальпы, пролатерально, субапикально и ретролатерально; 23–24 — дистальная часть пальпы, ретролатерально и апикально.

**FEMALE** (paratype). Coloration as in male, except somewhat more darker legs and abdomen, which are darker than the carapace (Fig. 5). Total length 6.35. Carapace 2.37 long, 1.62 wide. Eye diameters: AME 0.08, ALE 0.20, PLE 0.16, PME 0.11. Interdistance AME-AME 0.06. Leg measurements as shown in the table. Leg spination: FI–IV d1–0–0; MI–II v1–0–3(4); MIII–IV v1–1–3(4); elsewhere spines absent. Labium, sternum, and spinnerets as shown in Figs 13–14. Endogynae as in Figs 28–30. Receptacles round, not subdivided, separated by about four times their diameter.

**VARIATION.** Carapace length in females varies from 2.2 to 2.4; the peculiarities of the coloration are stable within the whole type series.

**DISTRIBUTION.** Southwestern and Eastern Azerbaijan: in foothills.

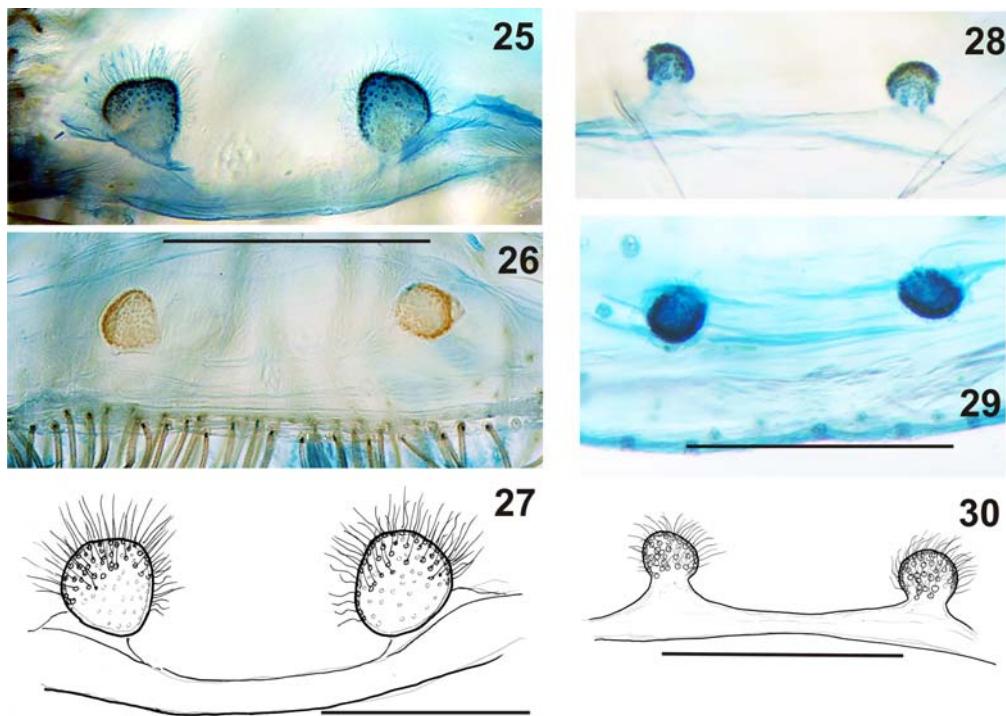

**HABITATS.** All specimens were collected in clayey and rocky semidesert areas.

**ACKNOWLEDGEMENTS.** We are grateful to all colleagues who supplied us with identified and unidentified material of *Filistata* from different parts of the Mediterranean, and particularly the following curators of museums: Kirill Mikhailov (ZMMU), the late Gershon Levi (HUJ), Dmitri Logunov (MMUM), Pekka Lehtinen and Seppo Ko-

ponen (ZMUT). Special thanks go to S. Koponen who arranged our stay in Turku and provided working facilities. The manuscript was reviewed by Dmitry V. Logunov and Mykola M. Kovblyuk (Simferopol). The senior author also thanks colleagues and partners of the expedition to Azerbaijan: Khalid Aliev, Elchin Huseynov and Natalia Snegovaya (Baku). The English of the final draft was kindly checked and corrected by David Penney (Manchester). This project was supported in part by the Russian Foundation for Fundamental Research (grant # 12-04-01548) and by the Ministry of Absorption, Israel.
