KEY WORDS: Spiders, Khibiny Mountains, Kola Peninsula, fauna, list of species.

КЛЮЧЕВЫЕ СЛОВА: Пауки, Хибины, Кольский полуостров, фауна, список видов.

**ABSTRACT.** An annotated check-list of spiders of the Khibiny Mountains (Kola Peninsula, Russia) based on both original and literature-derived data is presented for the first time. The list contains 161 species belonging to 17 families. Twenty species (*Araniella proxima*, *Cyclosa conica*, *Gnaphosa bicolor*, *G. lapporum*, *G. leporina*, *Zelotes clivicola*, *Agyrta affinis*, *A. rurestris*, *Ceratinella wideri*, *Dicymbium nigrum*, *Drapetisca socialis*, *Entelecara erythropus*, *Moebelia penicillata*, *Oedothorax apicatus*, *Porrhomma campbelli*, *Agroeca lusatica*, *Alopecosa pinetorum*, *A. taeniata*, *Philodromus cespitum*, *Titanoeca nivalis*) are recorded from Kola Peninsula for the first time. A preliminary analysis of the studied fauna is presented.

**РЕЗЮМЕ.** Впервые приведен аннотированный список пауков Хибин (Кольский полуостров, Россия), составленный на основе оригинальных сборов и литературных данных. Список включает 161 вид, относящихся к 17 семействам, из которых 20 видов (*Araniella proxima*, *Cyclosa conica*, *Gnaphosa bicolor*, *G. lapporum*, *G. leporina*, *Zelotes clivicola*, *Agyrta affinis*, *A. rurestris*, *Ceratinella wideri*, *Dicymbium nigrum*, *Drapetisca socialis*, *Entelecara erythropus*, *Moebelia penicillata*, *Oedothorax apicatus*, *Porrhomma campbelli*, *Agroeca lusatica*, *Alopecosa pinetorum*, *A. taeniata*, *Philodromus cespitum*, *Titanoeca nivalis*) отмечены впервые для Кольского полуострова. Проведен предварительный анализ изученной фауны.

#### Introduction

The Khibiny Mts are a small mountain system located in the central part of the Kola Peninsula. The first (and the only) report on spiders of the Khibiny seemed to be V.Y. Fridolin's [1936] monograph devoted to a general account of the Khibiny biota, referring to rep-

resentatives of three spider families: Araneidae, Lycosidae and Thomisidae. Unfortunately, the spider material collected by Fridolin was not found neither in the collections of the Zoological Museum of the Moscow State University (Moscow, Russia), nor in the Zoological Institute of the RAS (St. Petersburg, Russia) [K.G. Mikhailov, pers. comm.]. Therefore, it is unclear what spider species were found by Fridolin [1936]. Since that time, there have been no records of spiders from the Khibiny until the first decade of the 21st century.

At present, all the available data on the spider fauna of the Khibiny Mts and on spider distribution is scattered amongst a number of recently published papers [Tanasevitch, 2008; Vasilyeva, Nekhaev, 2009; Kamayev, 2010; Tanasevitch, Kamayev, 2011; Rybalov, Kamayev, 2012]. The most complete list was published by Tanasevitch & Kamayev [2011] in the paper devoted to the entire spider fauna of Kola Peninsula in which 77 species from the Khibiny Mts were reported. However, special studies on the Khibiny spider fauna are yet absent.

An extensive newly collected material on spiders from the Khibiny allows us to significantly expand a number of the species known from this region. The aim of the present paper is to give an updated account of the spider fauna of the Khibiny Mts. The paper contains new data that were obtained by different authors at different times and by various methods. The analysis of the studied spider fauna, including the UPGMA similarity of different habitats, provided below is to be considered provisional.

#### Study area, material and methods

The Khibiny massif does not exceed 50 km in its length. It is limited by Imandra and Umbozero Lakes from the west and east sides respectively (Fig. 1). Flat, dome- and ridge-like tops are typical of the Khibiny

(Fig. 2a) [Mishkin, 1953]. The climate of Khibiny Mts differs from the adjacent lowland areas: the winters are warm and settled while the summers are chilly and unsteady [Yakovlev, 1961]. Altitudes vary from 130 to 1200 m a.s.l. There are three main altitudinal belts in the Khibiny Mts: forest, subalpine and alpine ones [Mishkin, 1953; Shlyakov, 1961]. Position of the borders between the belts varies, depending on a mountain location, slope steepness and its exposition, and many other factors, hence only approximate limits of the belts can be outlined. **The forest belt** (Fig. 2b) covers the lower parts of slopes up to 260–400 m a.s.l. and is represented by different types of the spruce-pine forests (the northern taiga communities). **The subalpine belt** (Fig. 2c) includes the mountain birch forests and occurs at the elevations up to 500 m a.s.l. **The alpine belt** (Fig. 2a,d,e) occupies the largest part of the massif and includes the mountain tundra communities up to 850 m a.s.l. (Fig. 2a,d) and the ‘cold stony desert’ (Fig. 2e) [Mishkin, 1953] situated on the highest plateau and peaks above 850 m a.s.l. [Koroleva, 2001; Kremenetski *et al.*, 2004; Zenkova *et al.*, 2011]. The alpine tundra is subdivided into yernik, lichen and moss tundras. Intra-zonal communities, such as bogs, screes, cliffs, meadows and so on, exist in all three belts [Mishkin, 1953].

As the apatite-nepheline deposits are located in the Khibiny, the south-eastern part of the massif is strongly

damaged by intensive mining operations being performed there since the 1930s (Fig. 2f). Trial and prospecting pits occur in different parts of the mountains.

The spider collecting for the present study was carried out in the Khibiny in September 2008, June, August–September 2009, June–August 2010, June–August 2011, June–July 2013, and June–September 2014. The majority of samples was taken from native habitats. Anthropogenic habitats, including mining excavations, were also studied but less comprehensively as compared to native ones. The most intensive studies were conducted in the south part of the Khibiny Mts (Fig. 1). Spiders were mainly collected by pitfall traps and the sifting of moss and litter. Sweeping, hand collecting and soil sampling were also used (see additional information about the sampling method mentioned below under the description of each sample).

Some preliminary results of this study have already been published [Tanasevitch, 2008; Vasilyeva, Nekhaeva, 2009; Kamayev, 2010; Tanasevitch, Kamayev, 2011]. The material is temporary deposited in the personal author collection, and later will partly be deposited to the Zoological Museum of the Moscow State University (ZMMU), Moscow, Russia.

Details of the collecting localities are as given below. For an additional information about the localities on the NE slope of Vudyavrchorr Mt. see Zenkova *et*

**YU-2:** Yumechorr Mt., SW slope, 430 m a.s.l., dwarf shrub mountain birch forest with *B. pubescens*, leg. I.Z.

**YU-3:** Yumechorr Mt., SW slope ( $67^{\circ}42'27''$  N  $33^{\circ}15'10''$  E), 500 m a.s.l., dwarf shrub-lichen mountain tundra, leg. I.Z.

**YUK-1:** Yuksport Mt., SE slope ( $67^{\circ}38'59''$  N  $33^{\circ}47'17''$  E), 460–490 m a.s.l., dwarf shrub mountain birch forest, leg. I.Z.

**YUK-2:** Yuksport Mt., SE slope ( $67^{\circ}39'06''$  N  $33^{\circ}46'44''$  E), 625–645 m a.s.l., dwarf shrub-lichen mountain tundra on the slope, leg. I.Z.

**YUK-3:** Yuksport Mt., SE slope, ( $67^{\circ}39'32''$  N  $33^{\circ}46'44''$  E), 710–730 m a.s.l., dwarf shrub-lichen mountain tundra on the plateau, leg. I.Z.

The bulk of the material collected was identified by the author. The species identifications of the material collected by Ilya Kamayev were kindly provided to us by the latter colleague.

The recorded taxa are listed in the alphabetic order. The nomenclature generally follows that of World Spider Catalog [2015]; any differences/changes as compared to the WSC are marked in the text. The spider species that have been recorded to the Kola Peninsula for the first time are marked with (\*); the species that have not been found during our investigation are marked with (^). The codes given in square brackets correspond to the aforementioned localities. The findings of juveniles have been included in the list only if the adults of these taxa were not collected.

Unfortunately, spiders from the localities **V-lut1**, **V-ut1**, **V-be2**, and **V-pe2**, which were collected in September 2008 and June 2009 by different sampling methods, were mixed up during previous sorting. For these lots the dates and collecting methods are not listed.

Distributional ranges of the species are given according to Ivie [1969], Saaristo [1971], Leech [1972], Palmgren [1975; 1976; 1977], Dondale, Redner [1975; 1978; 1990], Ovtsharenko *et al.* [1992], Platnick, Dondale [1992], Eskov [1994], Esyunin, Efimik [1996], Saaristo, Eskov [1996], Logunov, Marusik [2000], Marusik *et al.* [2000; 2006; 2007], Azarkina, Logunov [2001], Marusik, Koponen [2005], Esyunin [2006], Tuneva [2006], Tanasevitch, Koponen [2007], Tanasevitch [2008; 2010; 2011; 2013; 2014], Marusik, Eskov [2009], Marusik, Altimov [2012], Blagoev *et al.* [2013], Esyunin *et al.* [2013], Mikhailov [2013], Kronestedt *et al.* [2014], Marusik, Omelko [2014].

In the Discussion section and Table 1, all the studied communities are indicated as follows: the communities predominated by *Picea* sp. are named “spruce forests”, those predominated by *Betula* spp. — “birch forests” (except for the “mountain birch forests”), all the mountain tundra communities are named «tundra». Furthermore, the spiders that were collected from the Yuksporr Mts (**YUK-1**; **YUK-2**; **YUK-3**), Yumechorr (**YU-1**; **YU-2**; **YU-3**), Suolayv (**SU-1**; **SU-2**; **SU-3**), and Aikuivenchorr (**Ai**) in 2013 and 2014 are not listed in Table 1 because the material has not been fully processed.

Faunistic similarities between the spider faunas of various biotopes have been calculated by the Dice coefficient in PAST 1.97 [Hammer *et al.*, 2001]. A dendrogram has been plotted by the UPGMA algorithm.

### List of species

#### Fam. AMAUROBIIDAE (1)

##### *Arctobius agelenoides* (Emerton, 1919)

PREVIOUS RECORDS. Vudyavrchorr Mt. [Tanasevitch, Kamayev, 2011].

MATERIAL. 1 ♂, 1 ♀, [**V-ut1**]; 1 ♀, [**V-lut2**], sift., h/c, VIII.2010; 1 ♂, [**VNE-1**], sift., 25.VII.2011.

RANGE. Palaearctic-W Nearctic arcto-boreal.

#### Fam. ARANEIDAE (2)

##### *Araniella proxima* (Kulczyński, 1885) \*

MATERIAL. 1 ♂, [**SU-3**], p/t, 22.06–10.07.2013.

RANGE. Holarctic boreal.

##### *Cyclosa conica* (Pallas, 1772) \*

MATERIAL. 3 juv, [**Im-1**], h/c, 30.VII.2011.

RANGE. Sibcircum-Holarctic boreo-nemoral.

#### Fam. CLUBIONIDAE (1)

##### *Clubiona kulczynskii* Lessert, 1905

MATERIAL. 1 ♂, [**Ai**], p/t, 21.06–8.07.2013.

RANGE. Holarctic boreo-nemoral.

#### Fam. DICTYNIDAE (1)

##### *Dictyna uncinata* Thorell, 1856

MATERIAL. 1 ♂ [**SU-2**], p/t, 22.06–10.07.2013, 1 ♂ [**SU-3**], p/t, 22.06–10.07.2013.

RANGE. Palaearctic boreo-nemoral.

#### Fam. GNAPHOSIDAE (10)

##### *Gnaphosa bicolor* (Hahn, 1833) \*

MATERIAL. 1 ♀, [**YU-1**], p/t, 16.06–7.07.2014; 1 ♂, [**SU-1**], p/t, 23.06–4.09.2014.

RANGE. West Palaearctic boreo-nemoral.

NOTE. This is the northernmost record of the species.

##### *Gnaphosa lapponum* (L. Koch, 1866) \*

MATERIAL. 8 ♂♂, 2 ♀♀, [**Lo-lumt**], p/t, 11–22.VI.2010; 1 ♂, [**K-lut3**], p/t, 17–31.VII.2010; 3 ♀♀, [**P-t**], p/t, 16–26.VI.2011.

RANGE. West Palaearctic boreo-montane.

##### *Gnaphosa leporina* (L. Koch, 1866) \*

MATERIAL. 1 ♂, [**YU-3**], p/t, 16.06–7.07.2014.

RANGE. Palaearctic boreal-nemoral.

##### *Gnaphosa muscorum* (L. Koch, 1866)

MATERIAL. 28 ♂♂, 2 ♀♀, [**K-ut2**], p/t, 17–31.VII.2010; 25 ♂♂, 4 ♀♀, [**K-lut3**], p/t, 17–31.VII.2010; 7 ♂♂, [**K-lut2**], p/t, 17–31.VII.2010.

RANGE. Subcircum-Holarctic arcto-boreal.

##### *Haplodrassus signifer* (C.L. Koch, 1839)

MATERIAL. 4 ♂♂, 1 ♀, [**Lo-be**], p/t, 11–22.VI.2010; 1 ♂, [**Lo-lumt**], p/t, 11–22.VI.2010.

RANGE. Holarctic polyzonal.

##### *Haplodrassus soerrenseni* (Strand, 1900)

MATERIAL. 13 ♂♂, 2 ♀♀, [**Lo-be**], p/t, 11–22.VI.2010; 2 ♂♂, [**Lo-lumt**], p/t, 11–22.VI.2010; 10 ♂♂, 3 ♀♀, [**P-p**], p/t, 16–26.VI.2011; 8 ♂♂, 4 ♀♀, [**P-b2**], p/t, 16–26.VI.2011; 3 ♂♂, [**P-b1**], p/t, 16–26.VI.2011.

RANGE. Palaearctic boreo-nemoral.

##### *Micaria aenea* Thorell, 1871

MATERIAL. 9 ♂♂, [**YU-2**], p/t, 16.06–7.07.2014; 11 ♂♂, [**YU-3**], p/t, 16.06–7.07.2014.

RANGE. Holarctic boreo-nemoral.

NOTE. Species was recorded for the Kola Peninsula previously from Korablekk Mt., Pasvik Nature Reserve [Zenkova *et al.*, 2013].

*Micaria alpina* L. Koch, 1872

MATERIAL. 1 ♂, [K-lt], p/t, 25–26.VI.2009; 1 ♀, [Lo-lumt], p/t, 11–22.VI.2010; 1 ♂, [VNE-4], sift., 26.VII.2011; 1 ♂, [YU-2], p/t, 16.06–7.07.2014; 1 ♂, 1 ♀, [YU-3], p/t, 16.06–7.07.2014; 1 ♂, 1 ♀, [YUK-1], p/t, 27.06–30.09.2014.

RANGE. Holarctic boreo-montane.

*Zelotes clivicola* (L. Koch, 1870) \*

MATERIAL. 1 ♂, [SU-2], p/t, 22.06–10.07.2013.  
RANGE. West Palaearctic boreo-nemoral.

*Zelotes subterraneus* (C.L. Koch, 1833)

MATERIAL. 1 ♂, [P-b2], p/t, 16–26.VI.2011; 1 ♀, [YU-3], p/t, 16.06–7.07.2014; 2 ♂♂, 1 ♀, [SU-1], p/t, 23.06–4.09.2014.  
RANGE. European polyzonal.

## Fam. HAHNIIDAE (3)

*Cryphroeca silvicola* (C.L. Koch, 1834)

PREVIOUS RECORDS. Vudyavrchorr Mt. [Kamayev, 2010; Tanasevitch, Kamayev, 2011]; near Kuelporr Vil. [Tanasevitch, Kamayev, 2011].  
MATERIAL. 1 ♂, 1 ♀, [V-pe1], s/s, VIII.2009; 1 ♂, [V-pe1], p/t, 6–16.VIII.2009; 1 ♂, [VS-be], p/t, 6–16.VIII.2009; 2 ♂♂, [V-bs], p/t, 6–16.VIII.2009; 1 ♀, [VS-be], sift., h/c, VIII.2009; 1 ♀, [V-bs], sift., h/c, VIII.2009; 1 ♀, [V-pe1], sift., VIII.2010; 4 ♀♀, [Bot-3], h/c, 22.VII.2011; 4 ♀♀, [Im-1], h/c, 30.VII.2011; 1 ♂, 5 ♀♀, [Bot-2], h/c, 22.VII.2011; 2 ♂♂, [P-p], p/t, 16–26.VI.2011.  
RANGE. Palaearctic boreo-nemoral.

*Hahnia ononidum* Simon, 1875

PREVIOUS RECORDS. Vudyavrchorr Mt.; near Kuelporr Vil. [Tanasevitch, Kamayev, 2011].  
MATERIAL. 1 ♂, 2 ♀♀, [V-pe1], s/s, VIII.2009; 1 ♂, [VS-be], s/s, VIII.2009; 2 ♂♂, 1 ♀, [V-bs], s/s, VIII.2009; 1 ♀, [V-lut2], s/s, VIII.2010; 1 ♂, 1 ♀, [VNE-4], sift., 26.VII.2011.  
RANGE. Holarctic boreo-nemoral.

*Hahnia nava* (Blackwall, 1841)

MATERIAL. 2 ♂♂, [SU-1], p/t, 23.06–4.09.2014.  
RANGE. Palaearctic boreal-nemoral.

## Fam. LINYPHIIDAE (102)

*Abacoproeces saltuum* (L. Koch, 1872) ^

PREVIOUS RECORDS. Near Kuelporr Vil. [Tanasevitch, Kamayev, 2011].  
RANGE. West Palaearctic boreo-nemoral.

*Abiskoaa abiskoensis* (Holm, 1945) ^

PREVIOUS RECORDS. Near Kuelporr Vil. [Tanasevitch, Kamayev, 2011].  
RANGE. Palaearctic boreal.

*Agnynantes expunctus* (O. Pickard-Cambridge, 1875)

MATERIAL. 1 ♀, [V-pe1], h/c, VIII.2009.  
RANGE. Palaearctic boreal.

*Agyneta affinis* (Kulczyński, 1898) \*

MATERIAL. 5 ♂♂, [P-b2], p/t, 16–26.VI.2011.  
RANGE. Palaearctic arcto-boreal.

NOTE. This is the northernmost record of the species.

*Agyneta cauta* (O. Pickard-Cambridge, 1902)

PREVIOUS RECORDS. Vudyavrchorr Mt. [Tanasevitch, Kamayev, 2011].

MATERIAL. 19 ♂♂, 5 ♀♀, [Lo-be], p/t, 11–22.VI.2010; 1 ♂, [P-t], p/t, 16–26.VI.2011; 19 ♂♂, 1 ♀, [P-p], p/t, 16–26.VI.2011; 22 ♂♂, 3 ♀♀, [P-b2], p/t, 16–26.VI.2011.

RANGE. European boreo-nemoral.

*Agyneta conigera* (O. Pickard-Cambridge, 1863)

MATERIAL. 2 ♂♂, 1 ♀, [Lo-be], p/t, 11–22.VI.2010; 1 ♂, [P-p], p/t, 16–26.VI.2011; 2 ♂♂, [P-b1], p/t, 16–26.VI.2011.  
RANGE. Palaearctic boreo-nemoral.

*Agyneta gulosa* (L. Koch, 1869)

MATERIAL. 2 ♂♂, [Lo-be], p/t, 11–22.VI.2010; 1 ♂, [Lo-lumt], s/s, 11.VI.2010; 1 ♀, [K-lut3], p/t, 17–31.VII.2010; 1 ♂, [K-lut2], p/t, 17–31.VII.2010; 1 ♂, 1 ♀, [VN-1], h/c, 1.VIII.2011; 4 ♀♀, [Im-2], sift., 30.VII.2011; 1 ♂, 1 ♀, [Im-3], sift., h/c, 30.VII.2011; 2 ♀♀, [Im-2], h/c under a stones on bald ground, 30.VII.2011; 1 ♀, [Bot-5], h/c, 22.VII.2011; 1 ♀, [VN-2], h/c, 24.VII.2011; 4 ♂♂, 1 ♀, [P-t], p/t, 16–26.VI.2011.  
RANGE. Palaearctic boreo-nemoral.

*Agyneta rurestris* (C.L. Koch, 1836) \*

MATERIAL. 4 ♂♂, 2 ♀♀, [Lo-lumt], p/t, 11–22.VI.2010.

RANGE. West Palaearctic polyzonal.

NOTE. This is the northermost record of the species.

*Allomengea scopigera* (Grube, 1859)

PREVIOUS RECORDS. Vudyavrchorr Mt. [Tanasevitch, Kamayev, 2011].

MATERIAL. 2 ♀♀, [VS-be], p/t, 6–16.VIII.2009; 1 ♀, [VS-be], s/s, VIII.2010; 1 ♀, [V-pe1], s/s, VIII.2010; 3 ♂♂, 20 ♀♀, [VS-be], p/t, 7–17.VIII.2010; 2 ♂♂, [V-bs], p/t, 7–17.VIII.2010; 1 ♂, 1 ♀, [V-ut2], p/t, 7–17.VIII.2010.  
RANGE. Palaearctic-West Nearctic boreo-nemoral.

*Bathyphantes eumenis* (L. Koch, 1879) ^

PREVIOUS RECORDS. Vudyavrchorr Mt. [Tanasevitch, Kamayev, 2011].

RANGE. Holarctic boreo-nemoral.

*Bathyphantes reprobus* (Kulczyński, 1916) ^

PREVIOUS RECORDS. Near Kuelporr Vil. [Tanasevitch, Kamayev, 2011].  
RANGE. Holarctic boreal.

*Bathyphantes setiger* F.O. Pickard-Cambridge, 1894 ^

PREVIOUS RECORDS. Vicinity of the MSUFS [Tanasevitch, Kamayev, 2011].

RANGE. Palaearctic boreo-nemoral.

*Bolephthyphantes index* (Thorell, 1856)

PREVIOUS RECORDS. Vudyavrchorr Mt. [Tanasevitch, Kamayev, 2011].

MATERIAL. 1 ♂, [P-b2], p/t, 16–26.VI.2011.

RANGE. Palaearctic boreo-nemoral.

*Bolyphantes alticeps* (Sundevall, 1833)

MATERIAL. 1 ♀, [Bog], sw. of *Chamerion* sp. along bog edge, 1.VIII.2011.

RANGE. Palearctic boreo-nemoral.

NOTE. This is the northermost record of the species.

*Bolyphantes luteolus* (Blackwall, 1833)

PREVIOUS RECORDS. Near Kuelporr Vil. [Tanasevitch, Kamayev, 2011].

MATERIAL. 1 ♀, [VNE-4], sift., 26.VII.2011; 4 ♀♀, [B-1], sw., 1.VIII.2011; 1 ♀, [VN-3], sift., 24.07.2011.

RANGE. West Palaearctic boreo-nemoral.

## Discussion

Over 4800 adult spider specimens belonging to 145 species of 17 families were collected during our investigation. A total list of the species of Khibiny Mts consists of 161 species belonging to 17 families. The family Mimetidae was represented only by juvenile specimens. Thirty one species (see Table 1; including five species — *Araniella proxima*, *Gnaphosa bicolor*,

*G. leporina*, *Zelotes clivicola*, *Titanoeca nivalis* — that were discovered during the final stage of this study) have not yet been found in other parts of the Kola Peninsula. Twenty species (*Araniella proxima*, *Cyclosa conica*, *Gnaphosa bicolor*, *G. lapponum*, *G. leporina*, *Zelotes clivicola*, *Agyneta affinis*, *A. rurestris*, *Ceratinella wideri*, *Dicyrbium nigrum*, *Drapetisca socialis*, *Entelecara erythropus*, *Moebelia penicillata*, *Oedothorax apicatus*, *Porrhomma campbelli*, *Agroeca lusatica*, *Alopecosa pinetorum*, *A. taeniata*, *Philodromus cespitum*, *Titanoeca nivalis*) and one family (Titanoecidae) have been reported from the Kola Peninsula for the first time.

The family Linyphiidae accounts for 63% of the total species diversity and presents in all the habitats studied. Lycosidae amounts only for 11% of the total species diversity. The proportions of other families are insignificant and do not exceed 3%, while Gnaphosidae and Thomisidae account for 6% and 4% respectively. The predominance of the linyphiids and lycosids is also a characteristic feature of the spider fauna of the entire Kola Peninsula [Tanasevitch, Kamayev, 2011], as well as of its tundra zone [Tanasevitch, Rybalov, 2010], and seems to be typical of European high altitude spider faunas [Koponen, 1993].

Some 90% of the species found in the Khibiny Mts display wide ranges, with the Holarctic and Palaearctic distribution being especially common. Boreo-nemoral and boreal species predominate and amount for 61% and 17% respectively. Arcto-boreal species are not numerous and account for 5% only.

The most abundant species in the studied material are *Agyneta cauta*, *Alopecosa aculeata*, *A. taeniata*, *Centromerus arcarius*, *Erigone dentipalpis*, *Gnaphosa muscorum*, *Hilaira herniosa*, *P. eiseni*, *P. lugubris*, *P. palustris* and *P. hyperborea*. The latter species is most abundant, being presented in the material by slightly less than 1000 specimens.

The highest species number (73) among the studied habitats has been observed in the best studied tundra communities (Table 1). Yet, a high species diversity has been discovered in the spruce forests (66), the mountain birch forests (61) and the birch forests (43). All other habitats have a less number of species probably due to their poorer exploration. On the contrary, in the Swedish mountains (Torneträsk area) [Holm, 1950] and in the northernmost Finnish low mountains (the vicinity of Kevo Subarctic Research Station) [Koponen, 1976], the species number decreases with the increase of altitude (particularly when changing from the taiga to the tundra).

Nearly a half of the collected species (61) were recorded from the only habitat type. Some of the unique species for both the tundra and the spruce forest are most numerous amounting for 23% (17 species) and 24% (16) respectively.

The majority of studied habitats were split into two main groups by means of the cluster analysis (Fig. 3). The first one includes the spider assemblages of the

main types of mountain communities (mountain birch forests, spruce forests, tundra communities, birch forests), whereas the other one – the habitats that not depend on altitude (meadows, riparian and anthropogenic habitats). The less studied sites (screes, pine forests, stony desert, bogs) turned out to be separated on individual branches on the dendrogram. Nine species (*Macrargus rufus*, *Mecynargus morulus*, *Oreonetides vaginatus*, *Pelecopsis mengei*, *Porrhomma pallidum*, *Semljicola latus*, *Tenuiphantes alacris*, *Walckenaeria karpiinskii*, *Zornella cultrigera*) were recorded in each type of the mountain habitats and were not found in other biotopes. Both *Leptorhoptrum robustum* and *Robertus lividus* were found in almost all the studied habitats (except for stony desert, bogs, pine forest and also screes for the latter species).

Despite the fact that the number of arachnological studies of the Khibiny Mts has increased recently, the data on spider distribution in this region are still incomplete. The number of spider species found there is lesser than that of the adjacent, well-studied Torne-träsk Mts (Sweden), from where there are as many as 190 recorded species [Holm, 1950; T. Kronestedt, pers. comm.]. Data on the spider fauna of some areas of the Khibiny still remain poor or are absent.
