Abstract. 2996 specimens (1636 males and 1360 females) of the families Ampulicidae and Sphecidae belonging to 119 species from 16 genera and 6 subfamilies were examined. Types of four sphecid wasp species are deposited in the collection of Siberian Zoological Museum of Institute of Systematics and Ecology of Animals, Novosibirsk, Russia.

Резюме. Изучено 2996 экземпляров (1636♂♂ и 1360♀♀) роющих ос семейств Ampulicidae и Sphecidae из 119 видов, 16 родов и 6 подсемейств. Типовые серии четырёх видов сфецид хранятся в коллекции Сибирского зоологического музея Института систематики и экологии животных СО РАН.

Introduction

The Museum was founded in 1960 as a laboratory named Zoological Museum in the Biological Institute of the Siberian Division of the Academy of Science of the USSR (currently the Institute of Systematics and Ecology of Animals, Russian Academy of Sciences, Siberian Branch).

Abbreviation of the Museum is SZMN (ISEN or ISEA follow the name of Institute in different publications).

The fund collection of digger wasps began to be actively replenished with material in the 1990s, mainly due to the collections of V.V. Dubatolov. Also, a significant contribution to the development of the collection made by A.V. Barkalov, V.K. Zintshenko, O.E. Kosterin (Novosibirsk), A.S. Shlyakhtenok (Minsk, Belarus).

Since 2007, the collection has also been replenished with materials by Yu.N. Danilov, A.M. Byvaltsev (Novosibirsk).

Proshchalykin M.Yu., V.M. Loktionov and A.S. Lelej (Vladivostok), M.V. Mokrousov (Nizhny Novgorod) and D.A. Milko (Bishkek, Kyrgyzstan) have made a significant contribution to the collection in recent years. Some

material was kindly provided to the collection by T. Ljubomirov (Sofia, Bulgaria).

A number of publications were prepared based on the collection material: Danilov, 2008; 2009; 2011a, b; 2012a, b; 2013; 2014a, b; 2015; 2017 a, b, c; Danilov, Tshernyshev, 2008; Danilov, Odintseva, 2013; Danilov, Mokrousov, 2017a, b; Danilov, Byvaltsev, 2020.

The classification of sphecid wasps is based on Pulawski [2020]. Subfamilies and genera are listed alphabetically.

Conclusion

The family Ampulicidae is very poorly represented in the collection — 4 species (2 % of the World fauna).

The family Sphecidae is represented by 115 species, which is 14.5 % of the World fauna. The vast majority of species in the collection are Palaearctic — 95 species (35 % of the Palaearctic fauna). Materials from Russia belong to 52 species, which is 75 % of the country's fauna.
