Природный музей Люцерн, Энтомология, пл. Казернен, CH-6003 Люцерн, Швейцария.

KEYWORDS. Central Europe, Heteroptera, Miridae, Phylinae, Hallopapini, *Cremnocephalus*, *Hallopapus*, *Mimocoris*, *Omphalonotus*, *Systellonotus*, taxonomy, faunistics.

КЛЮЧЕВЫЕ СЛОВА. Центральная Европа, Heteroptera, Miridae, Phylinae, Hallopapini, *Cremnocephalus*, *Hallopapus*, *Mimocoris*, *Omphalonotus*, *Systellonotus*, таксономия, фаунистика.

ABSTRACT. Diagnoses, illustrations of the male genitalia and an identification key are provided for the ten species of Central European Hallopapini.

РЕЗЮМЕ. Приведены диагнозы, рисунки гениталий самцов и определительные таблицы для 10 видов Hallopapini из Центральной Европы.

Introduction

The Hallopapini (Phylinae) contains 49 genera worldwide. The tribe is most species-rich in the Old World tropics, with the single New World taxon, *Cyrtopeltocoris* Reuter, 1875 being restricted to North America. Members of the tribe are usually elongate and range from relatively small to moderately large. In most species the females, and in some species also the males, are brachypterous. In many species, especially the females are ant-like. The male genitalia have an elongate, slightly sclerotized and distinctly sinuous vesica (Figs 1–39); female genitalia have a characteristic ventral sack (sensu Ehanno) [Magnien, 2000].

A work dealing with all Central European Hallopapini species has never been prepared. According to Günther & Schuster [2000] ten species of five genera are recorded from Central Europe. Two of them, viz. *Mimocoris rugicollis* (A. Costa, 1853) and *Systellonotus alpinus* Frey-Gessner, 1871, are recorded from Central Europe only from Switzerland [Frey-Gessner, 1871, 1872; Göllner-Scheiding & Rezbanyai-Reser, 1992]. A detailed work on the female genitalia of the Central European Hallopapini species, as the one on *Cremnocephalus* Fieber, 1860 [Magnien, 2000], as well as a cladistic analysis is beyond the present study and will be the subject of another study.

KEY TO CENTRAL EUROPEAN HALLOPAPINI SPECIES

- 1 Clavus brown with light narrow bands, those bands parallel to claval margins and ending in pointed tip, with light longitudinal band along midline interiorly, sometimes slightly diffuse but still recognizable 2
- Clavus brown without light narrow bands parallel to claval margins, but outer claval margin adjoining to corium with distinct longitudinal light band or clavus with transverse light band 3
- 2 Clavus with light narrow angle formed by longitudinal bands reaching almost to apex of clavus, base of cuneus with distinct broad white transverse band
Cremnocephalus albolineatus Reuter, 1875
- Clavus with light narrow angle formed by longitudinal bands extending over slightly more than $\frac{3}{4}$ of claval commissure, with light band interiorly; white transverse band at cuneus base narrow and usually not reaching inner margin of cuneus *C. alpestris* Wagner, 1941
- 3 Clavus brown with distinct longitudinal light band along outer claval margin adjoining to corium and sometimes longitudinal light band with transverse light band medially 4
- Clavus with transverse light band 6
- 4 Corium, including outer margin, bright yellow with matt brown spot medioapically; cuneus red-brown
Hallopapus suturalis (Herrich-Schaeffer, 1837)
- Corium light brown with light parts apically and basally 5
- 5 Borders of basal light parts of corium ambiguous; general aspect matt *H. montandoni* Reuter, 1895
- Borders of basal light parts clear and distinct; general aspect shiny *H. rufescens* (Burmeister, 1835)
- 6 Transverse light claval band at level of scutellum apex forming, in conjunction with light basal spots of hemelytra a collar-like band; hemelytra brown with narrow light band at base of cuneus; lateral margin of hemelytra slightly concave; females distinctly ant-like
Mimocoris rugicollis (A. Costa, 1853)
- Transverse light claval band more medially, not reaching claval commissure or sometimes lunate 7

- 7 Pronotum campanulate with distinctly swollen calli; claval band nearly behind apex of scutellum, distinct, not reaching claval commissure, not infrequently triangular and never lunate; corium dark brown to black with apical and basal ivory spots
..... *Omphalonotus quadriguttatus* (Kirschbaum, 1856)
- Pronotum not campanulate, calli not swollen; claval band located far from apex of scutellum, nearly lunate; corium not distinctly ivory and black, always with distinct glassy transverse band 8
- 8 Hemelytra basally brown with indistinct transverse orange band apically; in females hemelytra brown with glassy transverse band and indistinct orange spot apically; clavus brown with transverse light lunate band, basally with indistinct orange spot; cuneus red-brown
..... *Systellonotus alpinus* Frey-Gessner, 1871
- Hemelytra basally brown or orange with distinct transverse orange band apically 9
- 9 In male orange part of hemelytra broadly bordered by brown bands, base of hemelytra brown; clavus brown with narrow transverse light band; female distinctly ant-like; almost entirely black and hemelytra with triangular light spot *S. discoidalis* Horváth, 1894
- In male orange part of hemelytra narrowly bordered by brown bands, base of hemelytra with transverse orange band; clavus brown with distinct lunate light band; female distinctly ant-like; orange brown and hemelytra with triangular light spot narrowly bordered by brown bands *S. triguttatus* (Linnaeus, 1767)

The genus *Cremnocephalus* Fieber, 1860 was revised by Magnien [2000]. He recognized five species, two of which are recorded from Central Europe.

DIAGNOSIS. *C. alpestris* similar in coloration, size and shape to *C. albolineatus* but differs in the pale band parallel to the claval commissure reaching slightly past midpoint of the claval commissure. The part of vesica beyond secondary gonopore shorter than in *C. albolineatus* (Figs 1, 5).

The genus *Hallobanus* is widespread in the Old World with a main distribution in the tropics [Schuh, 1974]. Its distribution in the Indo-Pacific region was documented by Schuh [1984] as from southern Palaeoarctic to southern Africa east to Japan, south to New Guinea and northern Australia. A detailed work on the *Hallobanus* species from West and Central Africa is given by Linnauvori [1996]. *Hallobanus* contains 47 species; three of them are recorded from Central Europe.

Hallobanus montandoni Reuter, 1895 Figs 9–12.

Modrý Kamen, "Drienovka", 480-500m, 29.viii.1989, 1 ♂, leg. J. Stehlík (MMBC).

DIAGNOSIS. Similar to *H. rufescens* in size and coloration, but distinguished by the basal light parts of hemelytra not as distinct as in *H. rufescens* and general aspect matt; further distinguished by the shape of phallotheca and the wider anterior process of the left paramere wider (Figs 10–11). According to Günther & Schuster [2000] this species shows a more eastern distribution.

Hallobanus rufescens (Burmeister, 1835) Figs 13–16.

DIAGNOSIS. Recognized by its bright yellow hemelytra coloration with the distinct brown spots. Vesica very slender and weakly sclerotized (Fig. 17).

The genus *Mimocoris* contains two species, one of which is recorded from Central Europe, and there only from Switzerland [Günther & Schuster, 2000; Göllner-Scheiding & Rezbanyai-Reser, 1992].

Mimocoris rugicollis (A. Costa, 1853)
Figs 21–24.

Malé Karpaty Plav. Mikuláš Horlatka, 11.vi.1969, 1 ♂, leg. Pospišilová (MMBC). SWITZERLAND: Graubünden, Calanda, 1 ♀, on *Juniperus*, coll. Frey-Gessner (MNHG). Wallis, Sierre, 03.x.1948, 2 ♂, 1 ♀, leg. J. P. Wolf (ETHZ).

DIAGNOSIS. Recognized by its campanulate black pronotum with distinctly swollen calli. Left paramere robust, phallotheca slender and elongate (Fig. 26). Pronotum black, campanulate with distinctly swollen calli; clavus light transverse band medially not reaching claval commissure; hemelytra black with apical and basal ivory spots.

The genus *Systellonotus* contains 20 species, of which three are recorded from Central Europe, one of which, viz. *S. alpinus* Frey-Gessner, only from Switzerland [Frey-Gessner, 1871, 1872].

Systellonotus alpinus Frey-Gessner, 1871
Figs 29–31.

MATERIAL. SWITZERLAND: Tracuit, 29.vii., 1 ♀, *Systellonotus alpinus* Frey (MHNG; syntypes label). Berisal, Alpes, 1 ♂, coll. Frey (with date), right paramere is missing (MHNG).

DIAGNOSIS. Similar to *S. triguttatus* in coloration, but distinguished by the vesica being bifurcate apically (Fig. 29) and the phallotheca not as curved as in *S. discoidale* and *S. triguttatus* (Figs 30, 33, 37).

Frey-Gessner [1871] described *S. alpinus* from a single specimen of the Meyer-Dür collection identified as *S. triguttatus* (Linnaeus, 1767). There is, as usually with the Meyer-Dür material, no locality label on the specimen. A proper description was published later [Frey-Gessner, 1872]. Frey-Gessner found in 1871 a larva and an adult in July in the

alpine region above Zinal (Switzerland, Kanton Wallis, Tracuitalwand) on grass [Frey-Gessner, 1871 1872]. He mentioned that *S. alpinus* looks almost the same as *S. triguttatus* in shape and coloration, but that it is at least twice as large as *S. triguttatus*. Hollier [2004] mentioned that the specimens found in the collection of the Natural History Museum of Geneva could be syntypes or specimens captured later. The only female found in the MHNG collection shows the label "Tracuit, 29.vii" and an additional determination label "*Systellonotus alpinus* Frey", therefore Hollier treated it as a syntype [Hollier, 2004].

Systellonotus discoidalis Horváth, 1894

Figs 32–35.

MATERIAL. MACEDONIA: Skoplje, 06.v.1939, 1 ♂, det. Hoberlandt 1962 as *S. kiritschenkoi* = *scopliensis* (ZSMC). Nezezi, 07.v.1939, 1 ♀, det. Hoberlandt 1962 as *S. kiritschenkoi* = *scopliensis* (ZSMC). TURKEY: Kayseri-Talas, Ali-Dagh, 11.-17.vi.1960, 3 ♂, 15./22.vi.1962, 1 ♂, leg. Seidenstückler (ZSMC). Ankara, Gölbaschi, 12.vi.1962, 1 ♂, leg. Seidenstückler (ZSMC). Kayseri-Hisarcık, 17.vi.1962, 3 ♀, leg. Seidenstückler (ZSMC).

DIAGNOSIS. Similar to *S. triguttatus* but distinguished by its bifurcate and apically curved vesica (Figs 32, 35). The phallotheca more curved and round apically than in *S. alpinus* and *S. triguttatus* (Figs 29, 32, 36).

Systellonotus triguttatus (Linnaeus, 1767)

Figs 36–39.

MATERIAL. AUSTRIA: Hundsheimer Berge, 22.viii.1960, 2 ♂, leg. Weber (ZSMC). NSG Oberweiden, 161m, 16°50'E/48°17'N, 28.viii.2001, 1 ♂, 1 ♀, leg. W. Rabitsch (SWRW). Donautal, Umgb. A. Otto (ETHZ). Peney, 13.vi.1886, 2 ♂ (MNHG). Jura, Argori, 1 ♂, coll. Frey-Gessner (MNHG). Basel-Land, Reinach, 15.v.1945, 4 ♂, leg. J. P. Wolf (MNHG). Tessin, Prugiasco, 830m, 24.vii.1994, 1 ♂, leg. A. Otto (ETHZ). Wallis, Vuisse, 560m, 1.-10.viii.1990, light trap, 1 ♂, leg. Hächler & Rezb. Roser (NML). Wallis, Vuisse, Conthey, 560m, 590,2/120,4 11.-20.viii.1992, 1 ♂, leg. Rezbanyai-Roser & M. Hächler (NML). TURKEY: Kayseri, 21.-31.v.1963, 1 ♂, leg. Seidenstückler (ZSMC).

DIAGNOSIS. Distinguished from *S. discoidalis* by distinctly curved vesica with apical secondary gonopore, phallotheca pointed and curved (Figs 36–37).

ACKNOWLEDGEMENTS. For his 70th birthday I wish Prof. Kerzhner all the best and many happy and sunny days with his true bugs. His knowledge and work on true bugs is irreplaceable. I am very grateful for all his help and I want to thank him especially for his encouragement for my mirid

work and his great amiability. I had the privilege to meet Prof. Kerzhner at the second meeting of the International Heteropterists' Society meeting in St. Petersburg in 2002. For me as a young Heteropterist it was a magic moment to meet and to talk to one of the legends of heteropterology. Prof. Kerzhner took the time to talk with me about my mirid projects and helped me a lot with his comments and inputs, and let me partake in his enormous knowledge of Heteroptera. It is an honour to be part of the Festschrift for his 70th birthday.

For material I am grateful to the following people and institutions: Daniel Burckhardt (NHMB, Naturhistorisches Museum, Basel, Switzerland), Charles Huber (NMB, Naturhistorisches Museum, Bern, Switzerland), Igor Malenovský, Brno (NNMC, Moravian Museum, Brno, Czech Republic), Petr Kment (KUPC, Charles University, Department of Systematic Zoology, Prague, Czech Republic), Andreas Müller (ETHZ, Entomologische Sammlung der ETH, Zürich, Switzerland), Wolfgang Rabitsch (SWRW, Sammlung Wolfgang Rabitsch, Wien, Austria), Peter Schwendinger (MHNG, Muséum d'histoire naturelle, Genève, Switzerland), Klaus Schönitzer (ZSMC, Zoologische Staatssammlung, München, Germany). For helpful comments on an early stage of the manuscript I want to thank Daniel Burckhardt, Randall T. Schuh and Fedor Konstantinov I wish to thank for commenting on a later stage of the manuscript.
