KEY WORDS: Cossidae, Carpenter Moths, *Pseudozeuzera biatra*, morphology, Africa.

КЛЮЧЕВЫЕ СЛОВА: Cossidae, древооточцы, *Pseudozeuzera biatra*, морфология, Африка.

ABSTRACT. The article gives a detailed illustrated morphological redescription and catalog of the African genus *Pseudozeuzera* Schoorl, 1990. The image of female *P. biatra* (Hampson, 1910) is presented for the first time. The genus distribution map is provided. For the first time *P. biatra* are reported from Cameroon, Togo, Central African Republic, Congo and Gabon; *P. stenlii* Yakovlev, 2009 from Ghana, Code d'Ivoire and Uganda.

РЕЗЮМЕ. В статье приводится подробное иллюстрированное морфологическое переописание и каталог африканского рода *Pseudozeuzera* Schoorl, 1990. Впервые приводится изображение самки *P. biatra* (Hampson, 1910). Дана карта распространения представителей рода. Впервые *P. biatra* приводится для Камеруна, Того, Центрально-Африканской Республики, Конго и Габона, *P. stenlii* Yakovlev, 2009 — для Ганы, Кот-д-Ивуара и Уганды.

### Introduction

Carpenter moths (Lepidoptera: Cossidae) are a relatively well studied family listing about 1000 species group taxa [Nieukerken et al., 2011]. Every year, many new species are found, especially in the tropical regions. The work of Schoorl [1990] described a series of new genera, for which, unfortunately, detailed morphological diagnoses were not given.

The genus *Pseudozeuzera* Schoorl, 1990 was set for *Duomitus biatra* Hampson, 1910, described from Nigeria [Hampson, 1910] basing on significant external differences from other representatives of the subfamily

Zeuzerinae Boisduval, 1828, but genital features were not described. Schoorl [1990] basing on materials of BMNH indicated *P. biatra* for Sierra Leone, Nigeria, Ghana, Uganda. Later, Yakovlev [2009] described the new species *Pseudozeuzera stenlii* Yakovlev, 2009 from Congo. Continuing the revision of the subfamily Zeuzerinae, we give the genus redescription.

### Materials and methods

To prepare the work, materials from the following collections were examined: BMNH — Natural History Museum (London, G.B.); CMNH — Carnegie Museum of Natural History (Pittsburg, USA); MRAC — Museum Royal of Central Africa (Tervuren, Belgium); MSW — collection of Manfred Ströhle (Weiden, Germany); MWM — Museum of Thomas Witt (Munich, Germany); NHMO — Natural History Museum (Oslo, Norway).

Genitalia slides were examined with a Zeiss Stemi 2000 C microscope and images were taken with the Olympus XC 50 camera.

### Result

#### *Pseudozeuzera* Schoorl, 1990

Type species: *Duomitus biatra* Hampson, 1910 (by monotypy)

REDESCRIPTION. Male. Big size, wingspan 50–70 mm. Antennae short, bipectinate from base to middle, simple from middle to top. Thorax and abdomen covered with greyish scales, tegulae and patagia pale grey. Fore wing

narrow, long, pale with reticulated pattern of thin black transverse undulated lines and black longitudinal strokes; apex sharp. Hind wing short, with reticulated pattern, anal area without pattern; apex sharp.

Male genitalia. Uncus short, triangle, apex tapered; gnathos arms long, ribbon-like; valves lanceolate, with even anal edge, sacculus poorly expressed, no processes or harpes, costal edge of valve more sclerotized; juxta saddle-like, lateral processes long, lanceolate, saccus semicircular, of medium size; phallus short, thick, slightly curved in basal third, longitudinal wrinkles in apical third, robust spindle-like cornutus in lateral surface of vesica.

Female (description given on the unique specimen *P. biatra* from Congo) very big, wingspan 131 mm. Antennae filiform, black. Fore wing significantly wider than that of male, white, densely covered with grey scales in discal and

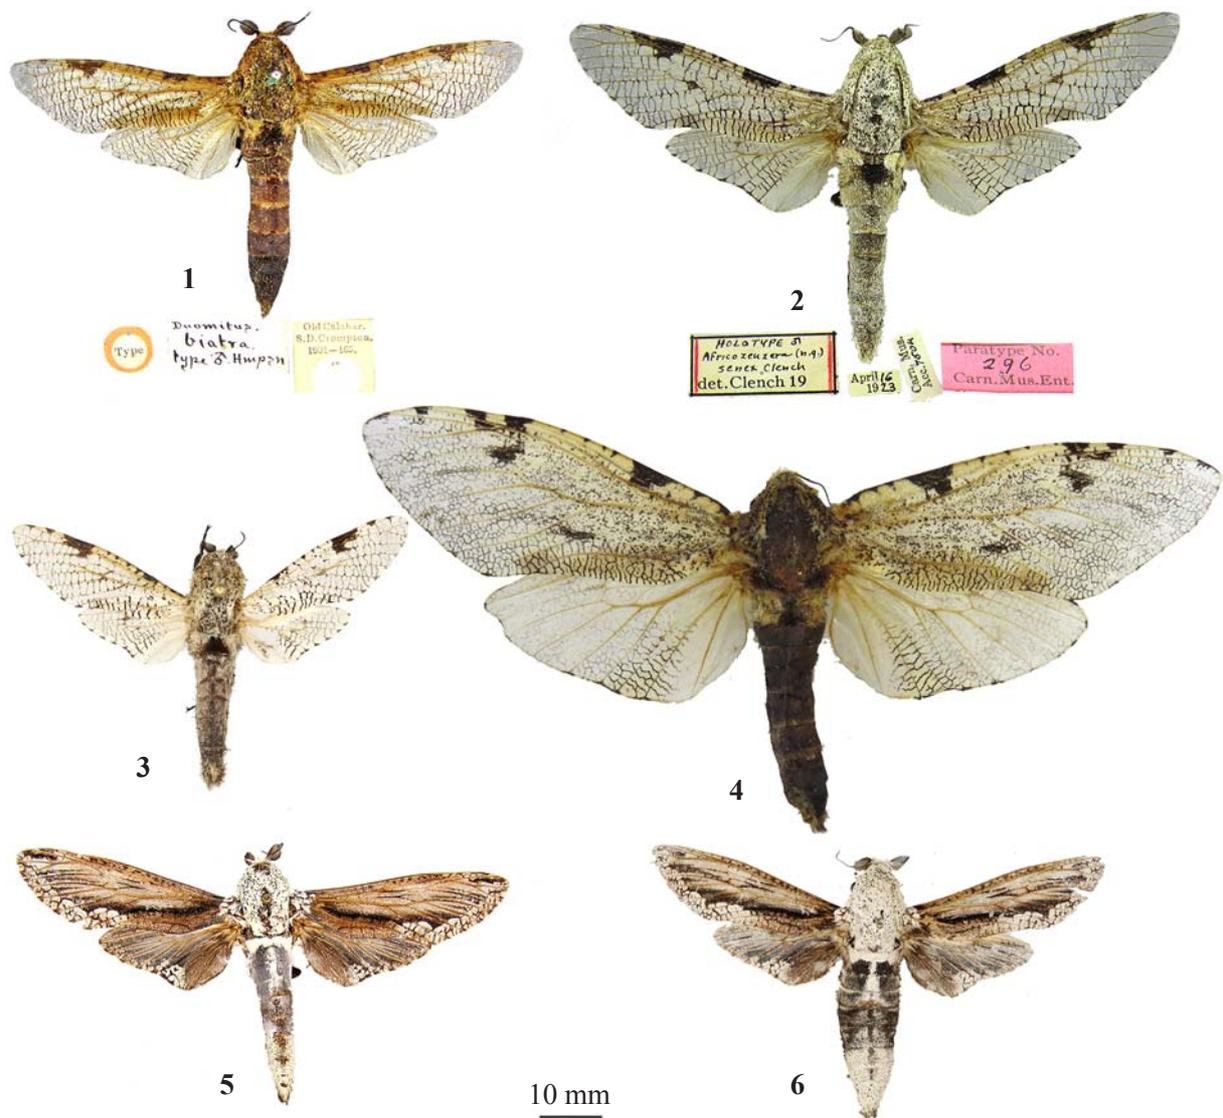

cubital areas of wing, dense reticulated pattern of thin black undulated lines and rare black strokes, more expressed on costal edge of wing. Hind wing wider than that of male, white, with dense reticulated pattern, anal area of wing white, without pattern.

Abdomen of female is prepared, filled with cotton, thus genitalia examination is not possible.

DIAGNOSIS. The genus *Pseudozeuzera* differs from other representatives of the subfamily Zeuserinae by very short hind wings in male and by the relatively short uncus.

DISTRIBUTION. Western and Central Africa.

TAXONOMICAL NOTES. The entomological collection of CMNH deposits the specimen *P. biatra* from Cameroon (Efulen), handwritten by H. Clench as the holotype "*Africazeuzera* (n.g.) *senex* Clench". This taxon has not been describes and can be accepted as "manuscript name".

**ACKNOWLEDGEMENTS.** The authors express their gratitude to the colleagues: Didier Van den Spiegel, Alice Buset (Tervuren), Jurate and Willy De Prins for the possibility to examine the materials on Cossidae at MRAC. We are indebted to the BMNH Council of Trustees for kindly granting me the permission to publish images of type specimens preserved in the Natural History Museum. The authors are grateful to Anna Ustjuzhanina (Tomsk) for the help in translation of the paper. The English text was reviewed by Prof. Boris Kondratieff (Fort Collins). We also express our gratitude to H. Sulak (Munich) and L. Aarvik (Oslo) for making the photo and to O. Bidzilya (Kyev) for the assistance in making genital preparations. The financial support for this study was provided by the grant No. 18–04–00440 A from the Russian Foundation for Basic Research.
